Introduction

The Metropolitan Washington Council of Governments (COG) in cooperation with the Federal Aviation Administration (FAA), the District of Columbia Department of Transportation, (DDOT), the Maryland Aviation Administration (MAA), and the Metropolitan Washington Airports Authority (MWAA), has conducted a metropolitan airport system planning process since 1978. The goal of this Continuous Airport System Planning (CASP) program is to provide a process that supports the planning, development and operation of airport and airport-serving facilities in a systematic framework for the Washington-Baltimore region.

Transportation planning at the regional level is coordinated in the Washington area by the National Capital Region Transportation Planning Board (TPB), which is staffed by COG's Department of Transportation Planning. The TPB is composed of representatives of the transportation agencies of the states of Maryland and Virginia, and the District of Columbia, local governments, the Washington Metropolitan Area Transit Authority, the Maryland and Virginia General Assemblies, and members from the MWAA and federal agencies. Established in 1965, the TPB is the official Metropolitan Planning Organization (MPO) designated by the federal government to carry out the comprehensive regional transportation planning process under the authority of the Federal-Aid Highway Act of 1962, as amended.

The TPB has a Technical Advisory Committee, which in turn, has several standing subcommittees. One of these subcommittees, the Aviation Technical Subcommittee (ATS), provides oversight and direction to the CASP program, including the preparation of this report.

In its role as the MPO, the TPB prepares the region's Constrained Long-Range Plan (CLRP) and Transportation Improvement Program (TIP). A key step in the CLRP and TIP preparation is the preparation of forecasts of travel demand over the planning period. Air passenger forecasts are directly used in the development of forecasts of locally originating ground access (passenger) vehicle trips to the region's three commercial airports. These forecasts of airport trips are included in the travel demand modeling for the CLRP.

The update of forecast air passenger ground access trips to the region's three commercial airports is an important step in the airport system planning process.¹ These airports are Baltimore/Washington International Thurgood Marshall Airport (BWI), Ronald Reagan Washington National Airport (DCA), and Washington Dulles International Airport (IAD). This report documents the latest update of ground access forecasts for the Washington/Baltimore Air Systems Planning region and the methodology used to update these forecasts. Detailed forecasts of average weekday local originating air passenger ground access trips from 161 Aviation Analysis Zones (AAZs) to each of the region's three commercial airports are presented in Appendix A of this report. Air passenger ground access trip forecasts are shown for the 2010 to 2040 forecast period. In Appendices B through D these forecasts are further broken out by major

¹ Airport ground access trips are made up of four major groups. These are (1) locally originating air passengers, (2) airport employees, (3) airport visitors, and (4) air cargo carriers. Air passenger trips typically account one-half of all airport ground access trips. Forecasts of other types of airport ground access trips are already included in the standard TPB travel demand modeling of auto, transit, and truck trips in the region.

ground access mode for each local AAZ to Airport origin-destination pair. These ground access forecasts will be used as inputs for the CLRP and as the basis for revising the Ground Access Element of the CASP Regional Airport System Plan.

Study Area

The Washington/Baltimore Air System Planning Region is larger than the combined areas that are normally within the Metropolitan Washington Council of Governments and Baltimore Metropolitan Council's purview. This combined area stretches from Harford County, Maryland, on the Susquehanna River to the north to Spotsylvania County, Virginia, in the south, and from the Chesapeake Bay in the east to the foothills of the Appalachian Mountains in the west. Figure 1 shows the jurisdictions that make up this region and depicts the location of the region's three commercial airports. In 2009, approximately 90% of locally originating air passengers flying out of one of the region's three airports began their ground access trip to the airport from a location within the boundaries of this Air System Planning Region. The other 10% of the locally originating air passengers came from areas beyond the borders of this region.

A locally originating air passenger is defined as air traveler beginning his or her air travel on a flight departing from one of the region's three airports. This definition excludes air travelers who are just connecting to another flight at one of the region's airport, but includes air travelers who are not residents of the Washington/Baltimore region who are making a return air trip home from a business or vacation trip to the Washington/Baltimore region. Thus, local originating air passengers can be either residents or non-residents of the Washington/Baltimore region. In fact, the results of the 2009 Washington/Baltimore Regional Air Passenger Survey showed that approximately 61% of all locally originating air passengers were non-residents who began their ground access trip to the airport from a hotel/motel, place of business, a private residence or other location in the Air System Planning region.

Figure 1: Washington-Baltimore Air Systems Planning Region

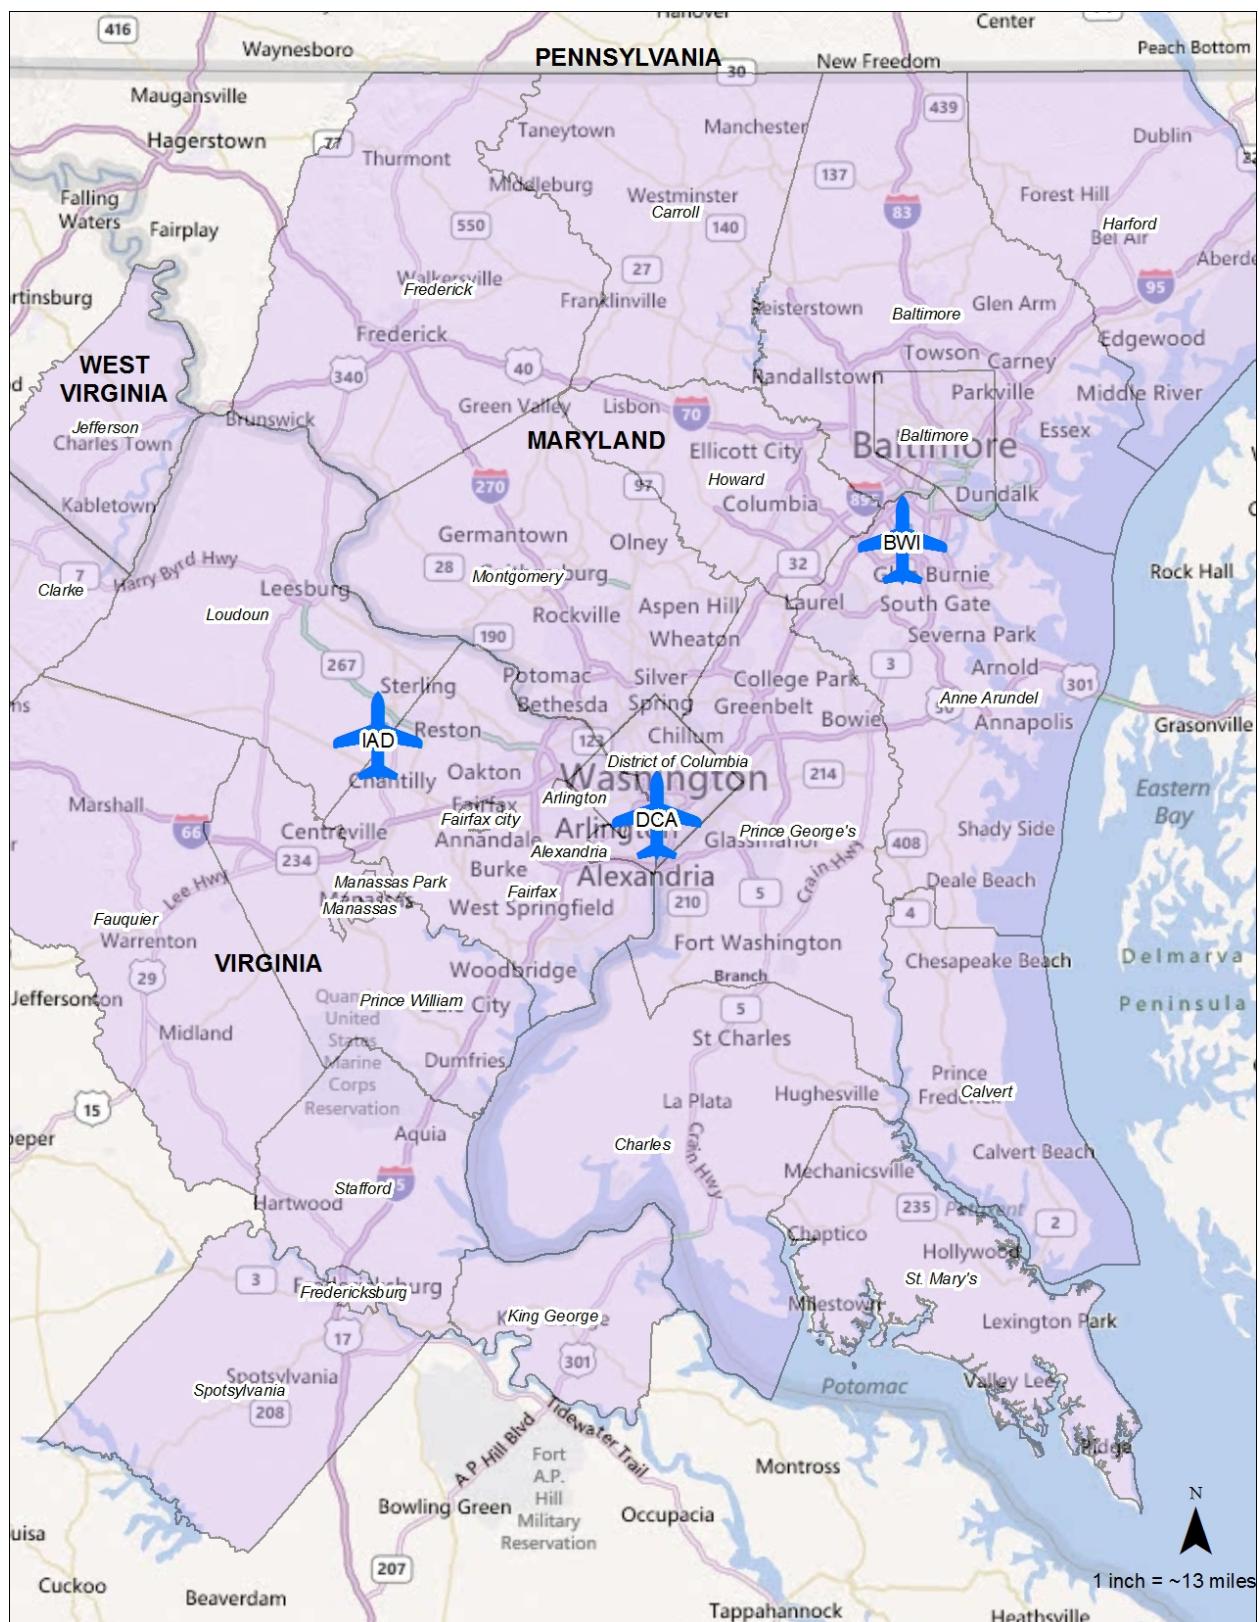

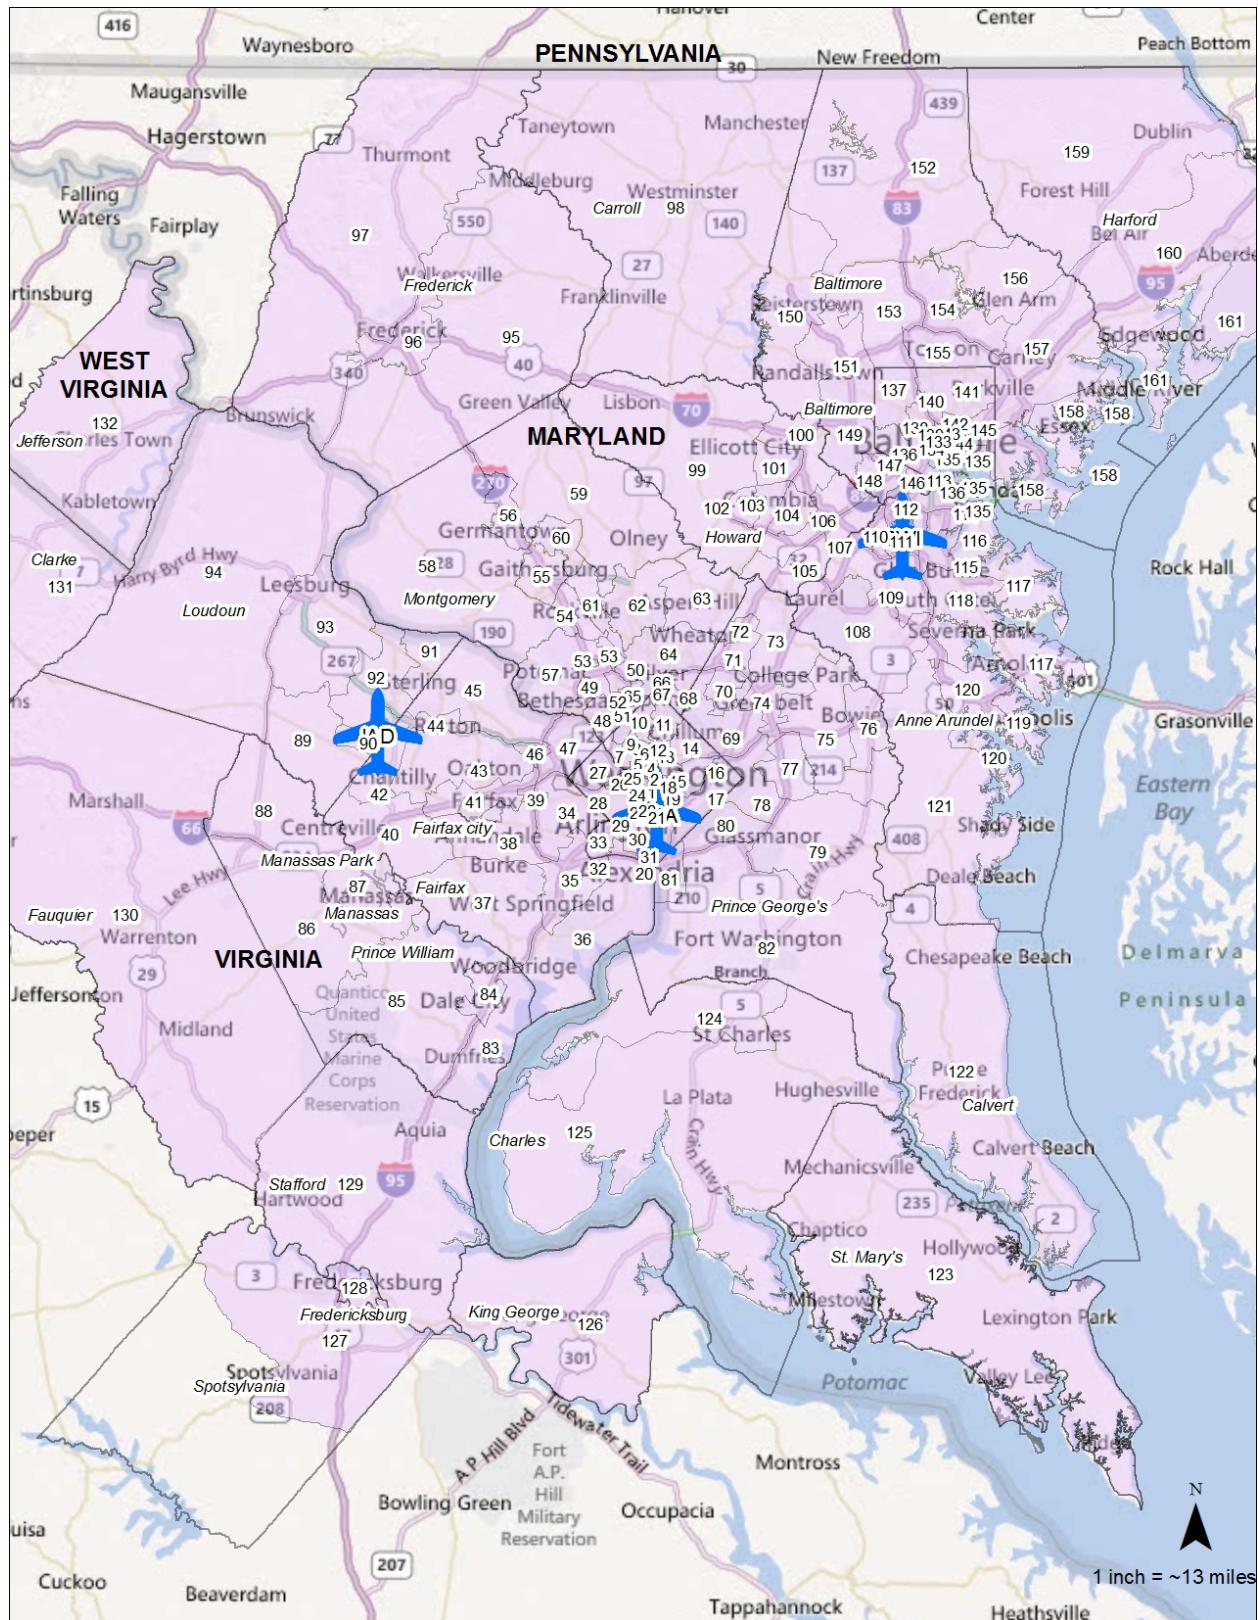

Figure 2: Washington-Baltimore Aviation Analysis Zones (AAZs)

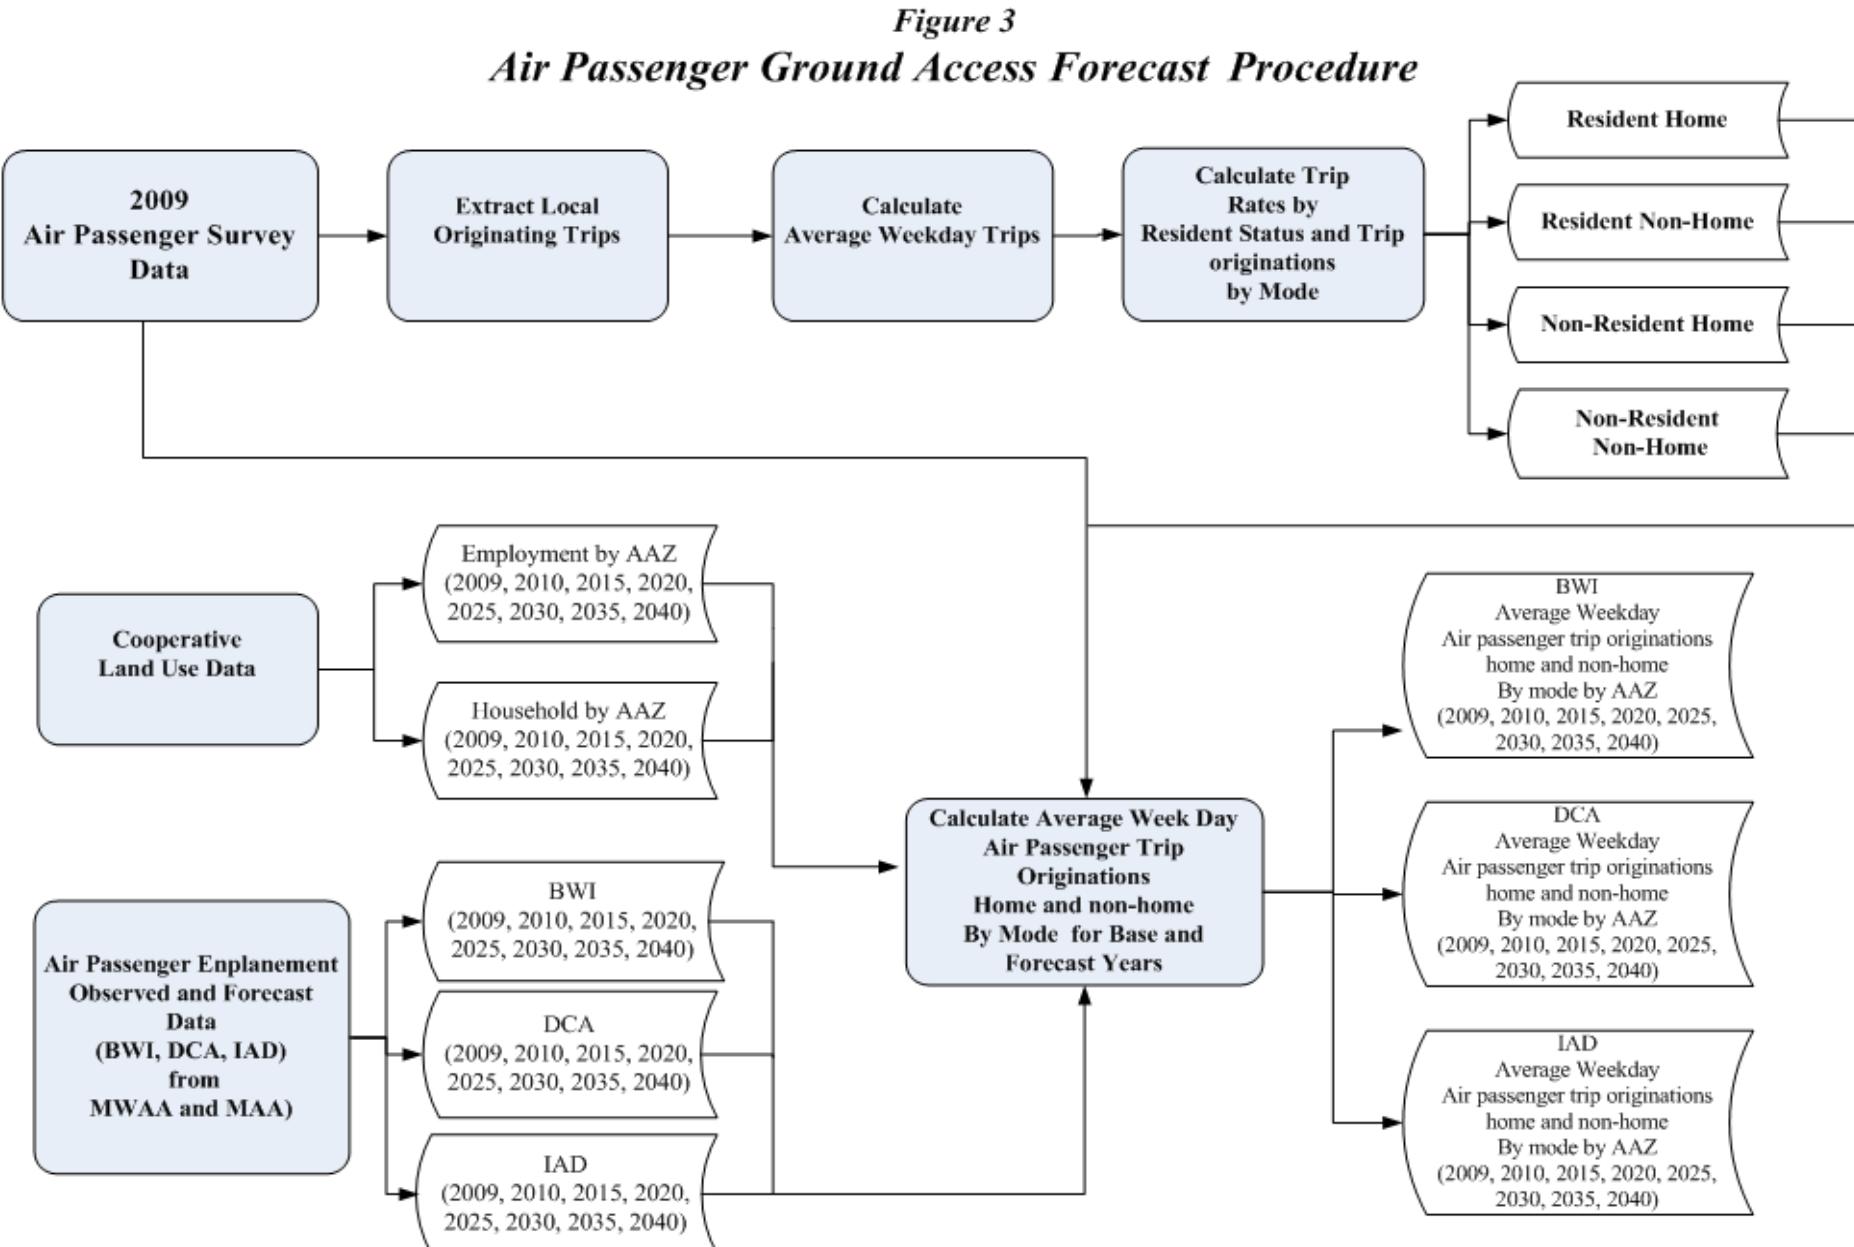

Air Passenger Ground Access Trip Forecasting Methodology

The update of air passenger ground access forecasts for Washington/Baltimore Air Systems Planning region was accomplished in a series of steps, illustrated in Figure 3. These steps were:

- Convert base year 2009 annual air passenger trips from Regional Air Passenger Survey to average weekday air passenger ground access trips.
- Summarize base year 2009 average weekday air passenger ground access trips by residential (home based) / non-residential (non-home based) trip origin type and area resident/non-resident status for each AAZ.²
- Summarize household and employment land activity data by new AAZ base year 2009 and all forecast years (2010, 2015, 2020, 2025, 2030, 2035 and 2040).
- Calculate base year 2009 air passenger ground access trip generation factors by home/non-home trip origin type and area resident/non-resident status for each airport-new AAZ pair.
- Calculate average weekday airport air passenger ground access trips to each airport for 2009 base year and all forecast years.
- Summarize base year 2009 weekday ground access trips by mode of arrival for each airport-new-AAZ-trip origin area type-resident-status classification.
- Calculate average weekday airport ground access trips by mode of arrival for 2009 base year and all forecast years.
- Calculate time-of-day split.

² In the context of air passenger ground access trips, a home-based trip refers to any airport ground access trip that begins at a private residence. For example, an airport ground access trip by a non-resident that begins at the home of friend or family member who lives in this region is considered to be a home-based trip, even though this starting location is not technically the “home” of the non-resident air passenger.

Figure 3: Air Passenger Ground Access Forecast Procedure

Conversion of 2009 Air Passenger Survey Data to Average Weekday Air Passenger Ground Access Trips

The first step in the update of airport ground access trips was converting annual air passenger trips from the 2009 Washington/Baltimore Regional Air Passenger Survey to average weekday figures. This was accomplished by (1) slightly adjusting the annual air passenger survey weights to exactly match the year 2009 observed enplanements at the three commercial airports; (2) selecting only the survey records for local originating air passengers making an airport ground access trips on a weekday; and (3) dividing the adjusted annual survey weights for each air passenger trip record using the following formula:

$$\text{Average Weekday Air Passenger Ground Access Trips} = \frac{\text{Annual Weekday Ground Access Trips}}{260}$$

Review of 2009 Air Passenger Survey data

30.8 million air passengers originated in the Washington-Baltimore Region in 2000 (see Table 1). Average weekday air passenger originations are further grouped into internal (local originating air passenger trips within the Washington-Baltimore Air System Planning Region), and external (local originating air passenger trips from areas outside the Washington-Baltimore Air System Planning Region), and are presented in Table 2.

Table 1: 2009 Washington-Baltimore Regional Air Passenger Survey – Annual Trip Originations by Airport (000s)³

Enplanement Type		BWI	DCA	IAD	Total
Local origination	<i>Number</i>	8,913	7,976	6,900	23,789

Review of Air Passenger Enplanement Forecast

Enplanement forecasts for the three commercial airports in the Washington / Baltimore region were provided by the Maryland Aviation Administration (MAA) for BWI and by the Metropolitan Washington Airports Authority (MWAA) DCA and IAD.

Table 3, Table 4, and Table 5 present observed and forecast air passenger enplanements for the three airports in the Washington/Baltimore region. Air passenger enplanements for BWI, are presented in Table 3. FAA forecasted enplanements at BWI to reach over 23.4 million by 2040, double the 2009 volume. At DCA, enplanements are projected to reach 12.5 million by 2040. Enplanements at IAD are projected to reach more than 33.2 million by 2040, a 183 percent increase from the 2009 volume.

Table 3: Annual Air Passenger Enplanement Forecasts - BWI

Year	Enplanements	Change	Avg Annual Compound Growth	
2009	10,496,865	¹

Market Segmentation

Based on the 2009 Washington-Baltimore Regional Air Passenger Survey data, enplanements were further grouped into local originations and internal originations. Table 6 shows the breakdown of these two types of originations by airport for base year 2009 and forecast years 2010 through 2040.

Table 6: Washington-Baltimore Regional Airports – Local and Internal AAZ Originating Trips

Local Originating Trips					Internal AAZ Originating Trips			
Year	BWI	DCA	IAD	Total	BWI	DCA	IAD	Total
2009	8,922	7,978	6,928	23,829	7,673	7,739	6,097	21,509
2010	9,347	8,222	7,088	24,657	8,039	7,976	6,237	22,251
2015	10,105	8,904	7,192	26,200	8,690	8,637	6,329	23,655
2020	11,617	9,358	8,863	29,838	9,991	9,077	7,800	26,868
2025	13,322	9,835	10,795	33,953	11,457	9,540	9,500	30,497
2030	15,279	10,337	13,148	38,764	13,140	10,027	11,570	34,737
2035	17,354	10,843	16,075	44,271	14,924	10,517	14,146	39,587
2040	19,871	11,408	19,904	51,183	17,089	11,066	17,515	45,670

Note:-

- Local originating trips are departing passengers who's trip starts from one of the region's three airports.
- Internal AAZ originating trips are local originating trips within the Washington/Baltimore Air System Planning Area.
- Local originating trips are calculated based on the 2009 Air Passenger Survey data to be 85% for BWI, 91% for DCA and 60% for IAD, of the total enplanements, shown on Tables 3, 4 and 5, respectively.
- Internal originating trips are calculated based on the 2009 Air Passenger Survey data to be 86% for BWI, 97% for DCA, and 88% for IAD, of the total local originating trips, that are within the 161 internal AAZ's.
- These data does not include external zones for PA, DE, WV, NJ or external VA and MD

Summarization of Base Year Air Passenger Ground Access Trips by Resident Status and Area Type

The next step in the process was to summarize the average weekday ground access trip data for each airport (BWI, DCA, and IAD) by trip origin type and resident status for each new AAZ in the air systems planning region. Ground access trip data for all external AAZs were summarized into a single combined external AAZ record. The weekday ground access data were summarized into two trip origin types (home-based, non-home based) and two resident status types (resident, non-resident). Thus, this processing summarized the ground access trip data into four categories for each airport-AAZ pair. These categories were:

- Resident Status=**Resident**, Origin Type=**Home-based**
- Resident Status=**Resident**, Origin Type=**Non-home based**
- Resident Status=**Non-Resident**, Origin Type=**Home-based**
- Resident Status=**Non-Resident**, Origin Type=**Non-home based**

Table 7, Table 8, and Table 9 show average weekday airport ground access trips for each airport summarized by these four categories. Resident and non resident trips were categorized into Home-Based (HB) and Non-Home-Based (NHB) trip purposes depending on the air passengers' trip origination, i.e., the starting point of the passenger's ground trip to the airport.

Table 7: Average Weekday Air Passenger Ground Access Trips by Resident Status and Trip Origin (Internal AAZs only) - BWI

Year	Resident		Non-Resident		Total
	Home-based	Non-Home Based	Home-based	Non-Home Based	
2009	11,110	1,602	6,088	10,121	28,921
2010	11,633	1,679	6,385	10,603	30,300

Summarize Land Activity Data for 2009 Base Year and Forecast Years

Household and employment land activity data for 2009 and forecasts for 2010, 2015, 2020 n 2025, 2030, 2035 and 2040 by small area TAZs were the latest small-area forecasts available obtained from MWCOG and BMC. The MWCOG data were the Round 8.1 Cooperative Forecasts and BMC data were their Round 7c land activity forecasts. These TAZ-level data were aggregated to the internal AAZs shown in Figure 2 above. Table 10 shows the combined MWCOG and BMC household forecasts and Table 11 shows the employment forecasts summarized for the entire air systems planning region.

Table 10: Washington-Baltimore Air System Planning Region Household Forecast

Year	Households	Change	Avg Annual Compound Growth	
2009	3,133,149	-		
2010	3,159,157	26,008	2009 - 2010	1%
2015	3,363,864	204,707	2010 - 2015	6%
2020	3,553,276	189,412	2015 - 2020	6%
2025	3,728,913	175,637	2020 - 2025	5%
2030	3,875,745	146,832	2025 - 2030	4%
2035	4,002,979	127,234	2030 - 2035	3%

Note: For regional transportation planning purposes, CTPP-based adjustments were applied to employment forecasts in selected non-MWCOG jurisdictions to account for definitional differences in employment.

Calculate Air Passenger Ground Access Trip Generation Factors

Once the air passenger ground access trip and land activity data were summarized, trip generation factors were calculated for each Airport/AAZ/trip origin type/resident-status classification using the following formulae:

A. Resident Home-based Trip Origin factor for Airport_(A) AAZ_(X)=

$$\text{Resident Home-based Factor} = \frac{\text{Total Resident Home-based Trip Origin Trips (AAZ}_X\text{) (Year 2007)}}{\text{Total Households (AAZ}_X\text{) (Year 2007)}}$$

B. Resident Non-home based Trip Origin factor for Airport_(A) AAZ_(X)=

$$\text{Resident Non-home based Factor} = \frac{\text{Total Resident Non-home based Trip Origin Trips (AAZ}_X\text{) (Year 2007)}}{\text{Total Employment (AAZ}_X\text{) (Year 2007)}}$$

C. Non-Resident Home-based Trip Origin factor for Airport_(A) AAZ_(X)=

$$\text{Non-Resident Home-based Factor} = \frac{\text{Total Non-Resident Home based Trip Origin Trips (AAZ}_X\text{) (Year 2007)}}{\text{Total Households (AAZ}_X\text{) (Year 2007)}}$$

D. Non-Resident Non-Home based Trip Origin factor for Airport_(A) AAZ_(X)=

$$\text{Non-Resident Non-Home based Factor} = \frac{\text{Total Non-Resident Non-home based Trip Origin Trips (AAZ}_X\text{) (Year 2007)}}{\text{Total Employment (AAZ}_X\text{ Year 2007)}}$$

Table 12: Washington-Baltimore Air System Planning Region – Home and Non-Home Based Trip Rates by Resident Status

Airport	Resident Trip Rate		Non-Resident Trip Rate	
	Home	Non-Home	Home	Non-Home
BWI	0.67188	0.05801	0.37265	0.42087
DCA	0.61073	0.03197	0.27473	0.44539

Calculate Air Passenger Ground Access Trips for 2007 and Forecast Years

Ground access trips for 2009, 2010, 2015, 2020, 2025, 2030, 2035, and 2040 were calculated by multiplying base year and forecast year household and employment data by the appropriate trip generation factors and adjusting the resultant product to be consistent with local air passenger originations estimated from approved MWAA and MAA totals for each airport. For each airport-AAZ combination:

- Air passenger ground access trips by residents with home-based trip origin types were calculated by multiplying AAZ households by the resident home-based trip origin trip generation factor.
- Air passenger ground access trips by residents with non-home-based trip origin types were calculated by multiplying AAZ employment by the resident non-home based trip origin trip generation factor.
- Air passenger ground access trips by non-residents with home based trip origin types were calculated by multiplying AAZ households by the non-resident home-based trip origin trip generation factor.
- Air passenger ground access trips by non-residents with non-home based origin types were calculated by multiplying AAZ employment by the non-resident non-home based trip origin trip generation factor.

The resultant products for each AAZ-origin type-resident-status classification were then summed by airport-AAZ pair and totaled for each airport. This total was then divided by a previously determined MWAA and MAA control total for local passenger originations at that airport to obtain a MWAA and MAA adjustment factor. This adjustment factor was then applied to all airport-AAZ pairs to ensure that the sum of the calculated ground access trips by AAZ for that airport would match the approved MWAA and MAA forecasts.

Table 13 shows calculated 2009 to 2040 air passenger average weekday ground access trips totals by airport for the entire Air Systems Planning Region. Detailed 2009 to 2040 average weekday air passenger ground access trips by AAZ are presented in Appendix A.

Table 13: Average Weekday Air Passenger Ground Access Trips (Internal AAZs only)

Forecast Year	BWI	DCA	IAD	Total
2009	28,923	29,110	22,722	80,755
2010	30,300	30,001	23,245	83,546
2015	32,755	32,487	23,586	88,828
2020	37,659	34,144	29,068	100,871
2025	43,186	35,886	35,404	114,476
2030	49,528	37,716	43,121	130,365
2035	56,254	39,562	52,719	148,535
2040	64,413	41,625	65,278	171,315

Summarize 2009 Base Year Air Passenger Ground Access Trips by Mode of Arrival

The next step in the process was to summarize the average weekday ground access trip data from the 2009 Air Passenger survey by mode of arrival for each airport-AAZ pair by trip origin type and resident status. The ground access trip data were summarized into four major arrival modes as follows:

- Auto: Private Car, Rental Car and Taxi
- Transit: Metrorail, Amtrak / MARC / VRE and Light Rail
- Airport Transit: Airport Bus / Limo and Hotel / Motel Courtesy Shuttle
- Other: Charter Bus, Employer Shuttle, and All Other

The auto mode of arrival was further split into two sub-categories:

- Auto Driver
- Auto Passenger

The split of auto ground access trips into auto driver and auto passenger trips was determined from the air passenger survey question that asked for the total number of household members, friends, or business associates that traveled with the surveyed air passenger to the airport. From this question the total vehicle occupancy of air passengers arriving at the airport by private or rental cars could be determined. The reciprocal of this number yields the proportion of air passengers who were likely auto drivers. The complement of this reciprocal yields the proportion of air passengers who were likely auto passengers. Multiplying the survey record weights by these proportions produces estimates of the number of air passengers who were auto drivers and the number of air passengers who were auto passengers for these auto ground access trips. Air passengers arriving at the airport by taxi are by definition auto passengers.

Once the ground access mode of arrival trip data were summarized, modal shares for Auto Driver, Auto Passenger, Transit, Airport Transit and Other arrival modes were calculated for each airport/ AAZ / trip origin type / resident status classification.

Calculate Air Passenger Ground Access Trips by Mode for 2009 Base Year and Forecast Years

Air passenger ground access trips to BWI by mode of arrival for 2009 through 2040 were estimated by multiplying respective year ground access trips for each BWI-AAZ / trip origin type / resident status classification by the base year modal shares for that classification.

Air passenger ground access trips to DCA and IAD by mode of access were estimated in the same way as was done for BWI. For forecast year 2015 and beyond, however, initial estimates of ground access trips by mode of arrival were further adjusted to take into account the planned opening of the Metrorail extension to IAD anticipated in 2015.

The adjustment for IAD was made by taking the 2015 Metrorail air passenger ridership projection from the Dulles Extension FEIS (Final Environmental Impact Statement) Patronage Forecast Report (November 2004) for the Dulles Airport station and allocating this air passenger-related ridership to selected AAZs in the Air System Planning region. This allocation was based upon an examination of the air passenger ground access trips by Metrorail to DCA in 2007, the characteristics of the AAZs from which these DCA Metrorail ground access trips were made, and the modal share of each ground access mode to DCA from these AAZs. No independent mode choice modeling was done and professional judgment was used to allocate the FEIS Metrorail ridership projection to individual AAZs and adjusting the other ground access modal share percentages from these AAZs to IAD accordingly. These adjusted modal shares were then applied to total ground access trips to IAD by AAZ for 2015, 2020, 2025 and 2030 to obtain final adjusted estimates of ground access trips by mode for these forecast years.

Adjustments to initial estimates of DCA air passenger ground access trips to take into account the expected opening of the Dulles Extension in 2015 were fairly limited in geographic scope because the Vienna Metrorail line and other lines throughout the region already well serve DCA. Thus, adjustments to modal shares were only made for a few select AAZs in the Tysons/Dulles Corridor (AAZs 43, 44, 45, 89, 91 and 92). Again, no mode choice modeling was done and professional judgment was used in making these adjustments. These adjusted modal shares were then applied to total air passenger trips to DCA from these selected AAZs for 2015, 2020, 2025 and 2030 to obtain final adjusted estimates of ground access trips by mode for these forecast years. Table 14, Table 15, and Table 16 show air passenger ground access forecast to each airport by mode for the base and forecast years. These data are graphically displayed in Figure 4.

Table 14: Average Weekday Air Passenger Ground Access Trips by Mode of Access - BWI⁴

Year	Auto Driver	Auto Passenger	Transit	Airport Transit	Other	Total

Time-Of-Day Split

The 2009 air passenger survey data has scheduled flight time for the survey records. Two separate time-of-day split factors were developed using the survey data. Time-of-day is calculate, as a percent of total trips departing one-hour and/or two hours before the flight time, and is shown in Table 12. These are:

One-Hour before flight time:-

1. AM trips = flight time 700 to 1000 (7:00 AM to 10:00 AM).
2. PM trips = flight time 1600 to 1900 (4:00 PM to 7:00 PM).
3. Off-Peak trips = flight time 600 to 700, 1000 to 1600, and 1900 to 2400.
(6:00-7:00 AM, 10:00 AM-4:00 PM, and 7:00 -12:00 PM).

Two-Hours before flight time:-

1. AM trips = flight time 600 to 900 (6:00 AM to 9:00 AM).
2. PM trips = flight time 1500 to 1800 (3:00 PM to 6:00 PM).
3. Off-Peak trips = flight time 900 to 1500, and 1800 to 2400.
(9:00 AM-3:00 PM, and 6:00 12:00 PM).

Summary and Conclusion

The update of forecast air passenger ground access trips to the region's three commercial airports is an important step in the airport system planning process. This report documents the CASP update of forecast ground access trips to BWI, DCA and IAD from AAZs in the Washington-Baltimore Air Systems Planning Region. These forecasts are detailed by major mode of arrival at each airport for 2009 and by 5-year intervals for the 2010 to 2040 forecast period. Although no independent mode choice modeling has been performed in this study, these forecasts have been adjusted based on the ridership projection from the Dulles Extension FEIS Patronage Forecast to account for the anticipated impact on air passenger ground access travel to Dulles Airport resulting from the planned opening of the Dulles Metrorail line extension in 2015.

These ground access forecasts will be used as inputs for the CLRP update and as the basis for revising the Ground Access Element of the CASP Regional Airport System Plan, both scheduled to occur in 2013.

The ground access forecast, developed in this update by AAZ represents 4,368 Transportation Analysis Zones (TAZ). Of the 161 AAZ's in the study area, 132 are within the MWCOG planning region. Therefore, the ground access forecasts are further disaggregated into the 3,669 TAZ's in the MWCOG planning area by mode and time-of-day as an input to the regional travel demand model process.
