

Sustainable Materials Management

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

What is Sustainable Materials Management?

Historical approach to conserving resources:

- Reduce, Reuse, and Recycle

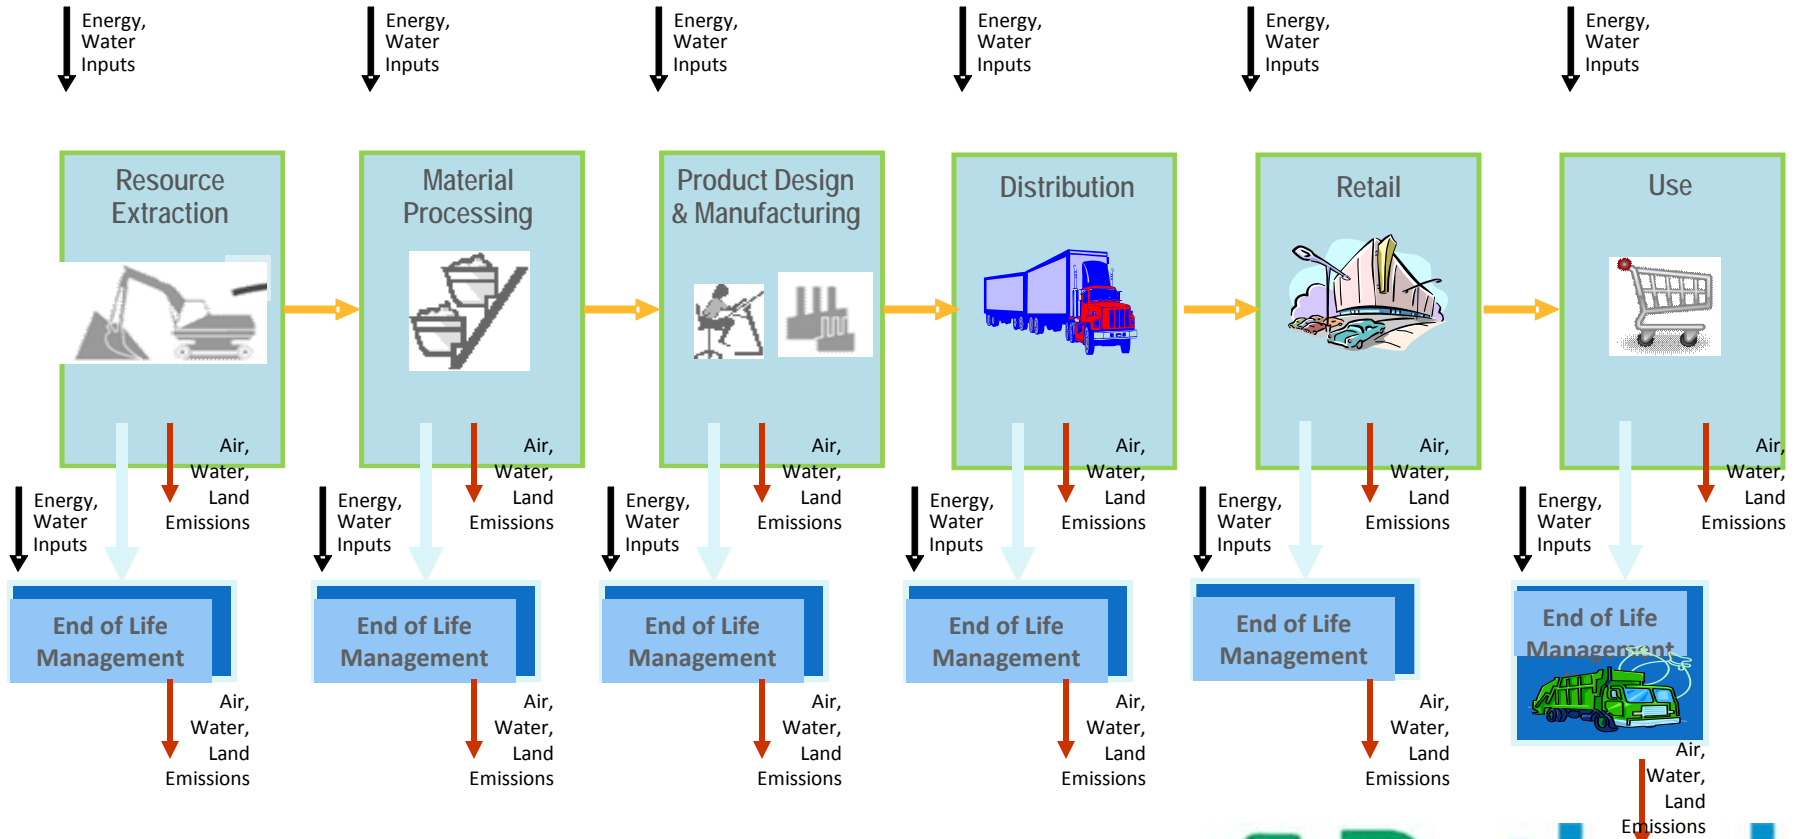

Our approach moving forward:

- refocus our thinking to consider how materials are managed over their entire life cycle

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

Material/Product Life Cycle

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

How is SMM different from Reduce, Reuse, Recycle?

Reduce, Reuse, and Recycle is an end-of-life perspective

SMM considers the entire lifecycle

We care about all environmental impacts, so SMM gives us a more complete picture of how we should manage materials, goods and services

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

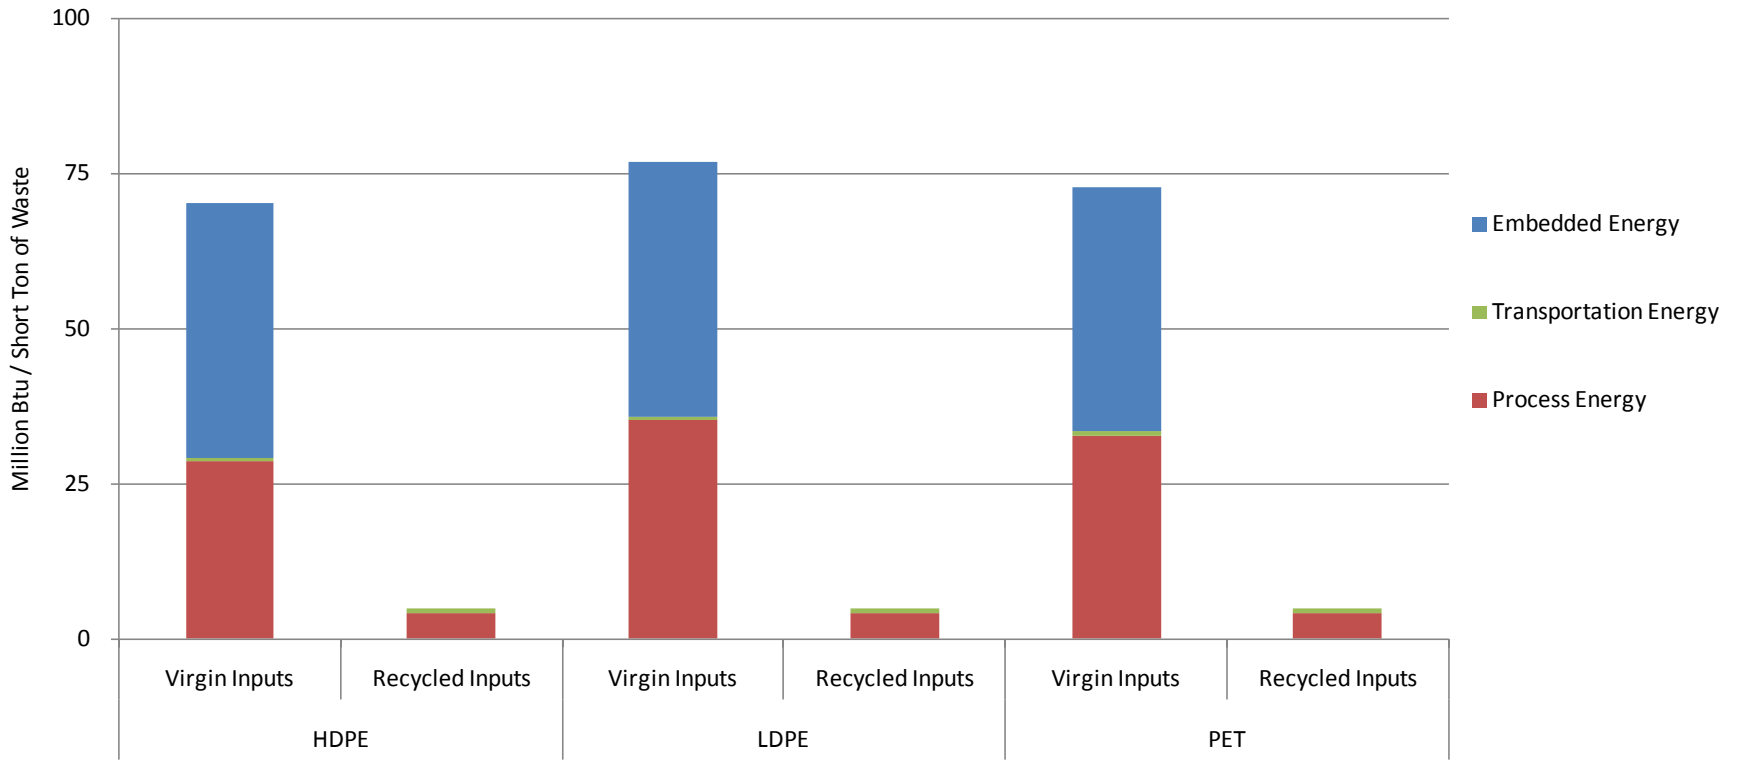

Recycling is an Important Part of SMM

- GHG emissions associated with energy production are avoided through recycling & source reduction
 - For most materials, the manufacturing process energy for recycled materials uses a fraction of the energy used to produce virgin materials.
- Use less energy – produce fewer GHGs

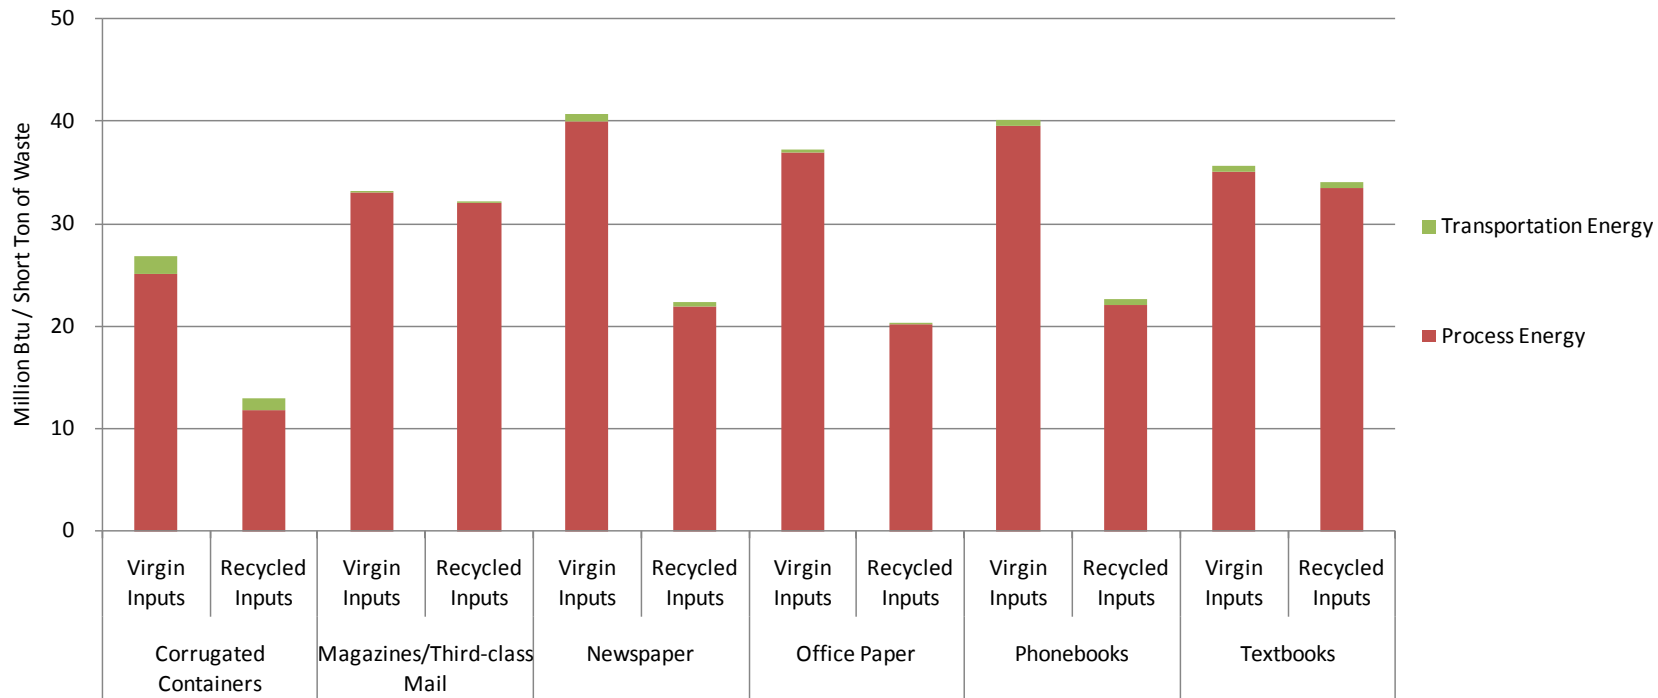

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

Energy Required for Product Manufacture from Virgin and Recycled Inputs - Plastics

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

Energy Required for Product Manufacture from Virgin and Recycled Inputs - Paper Products

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

Recycling is an Important Part of SMM

- Forest carbon sequestration increases when wood products are source reduced & recycled
 - trees sequester carbon from the atmosphere through photosynthesis, converting CO₂ in the atmosphere to carbon in their biomass.
- Carbon storage increases when organics are composted and added to soil

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

Recycling is an Important Part of SMM

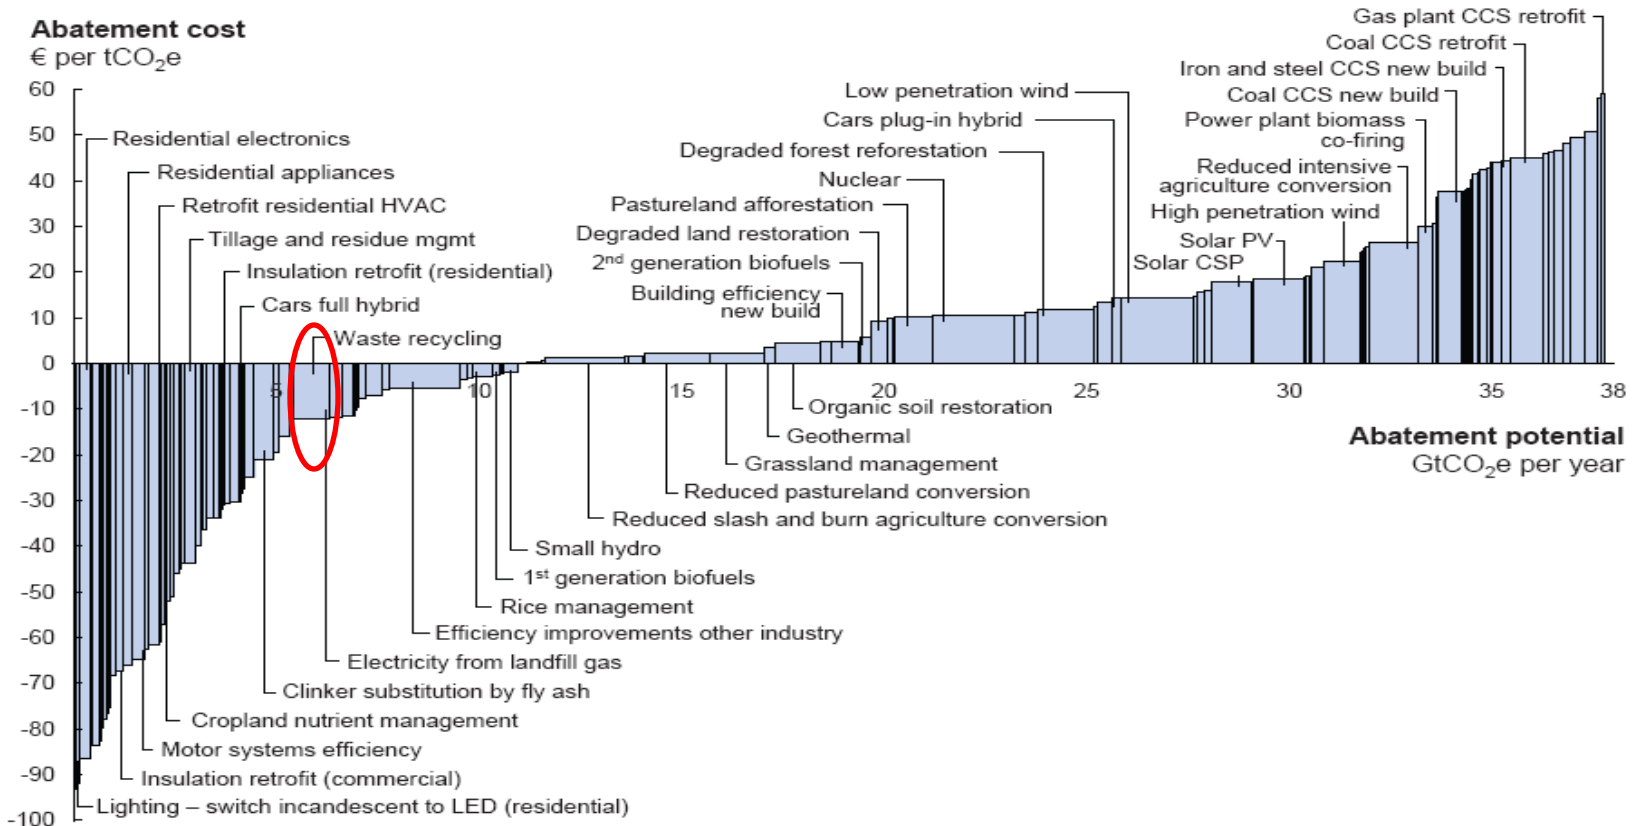

- Recycling & Source Reduction Avoid:
 - CH₄ emissions from landfills
 - CO₂ emissions from waste combustion

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

Recycling is a cost-effective GHG abatement strategy

Global GHG abatement cost curve beyond business-as-usual – 2030

Note: The curve presents an estimate of the maximum potential of all technical GHG abatement measures below €60 per tCO₂e if each lever was pursued aggressively. It is not a forecast of what role different abatement measures and technologies will play.
 Source: Global GHG Abatement Cost Curve v2.0

 - <http://www.epa.gov/cleanenergy/energy-resources/calculator.html>

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

WARM

- Web-based and Excel (downloadable)
- 46 material types
- Baseline and alternative management scenarios
 - source reduction, recycling, combustion, composting, and landfilling
- GHG (MTCO₂e or MTCe) and energy (mBTUs)

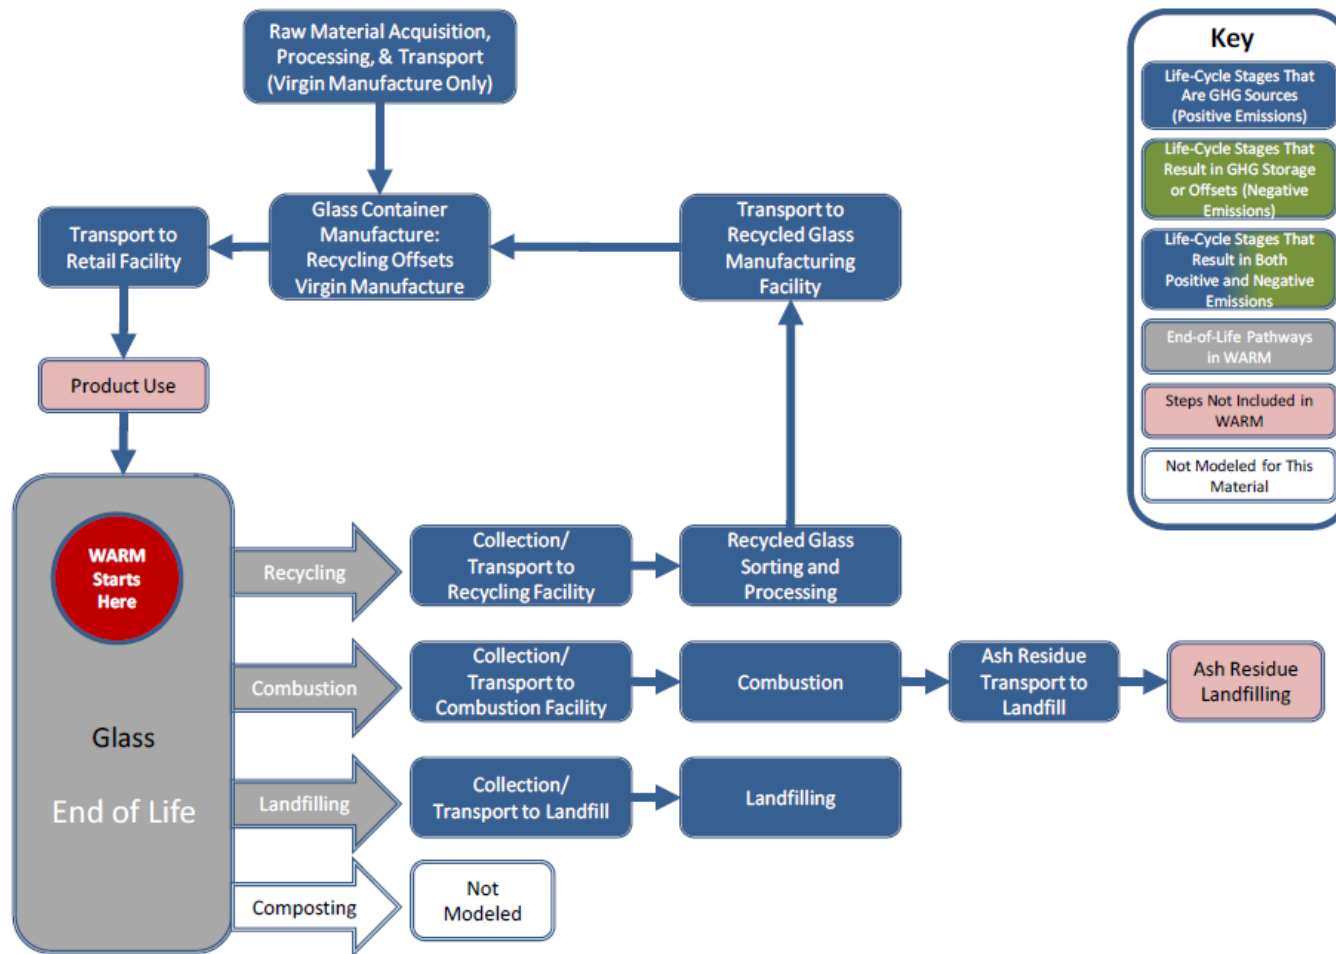

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

Material Types Recognized by WARM

Aluminum Cans	Grass	Office Paper
Aluminium Ingot	HDPE	Personal Computers
Asphalt Concrete	LDPE	PET
Asphalt Shingles	Leaves	Phonebooks
Branches	LLDPE	PLA
Carpet	Magazines / Third-Class Mail	PP
Clay Bricks	Medium-density Fiberboard	PS
Concrete	Mixed Metals	PVC
Copper Wire	Mixed MSW	Steel Cans
Corrugated Cardboard	Mixed Organics	Textbooks
Dimensional Lumber	Mixed Paper (general)	Tires
Drywall	Mixed Paper (primarily from offices)	Vinyl Flooring
Fiberglass Insulation	Mixed Paper (primarily residential)	Wood Flooring
Fly Ash	Mixed Plastics	Yard Trimmings
Food Scraps	Mixed Recyclables	
Glass	Newspaper	

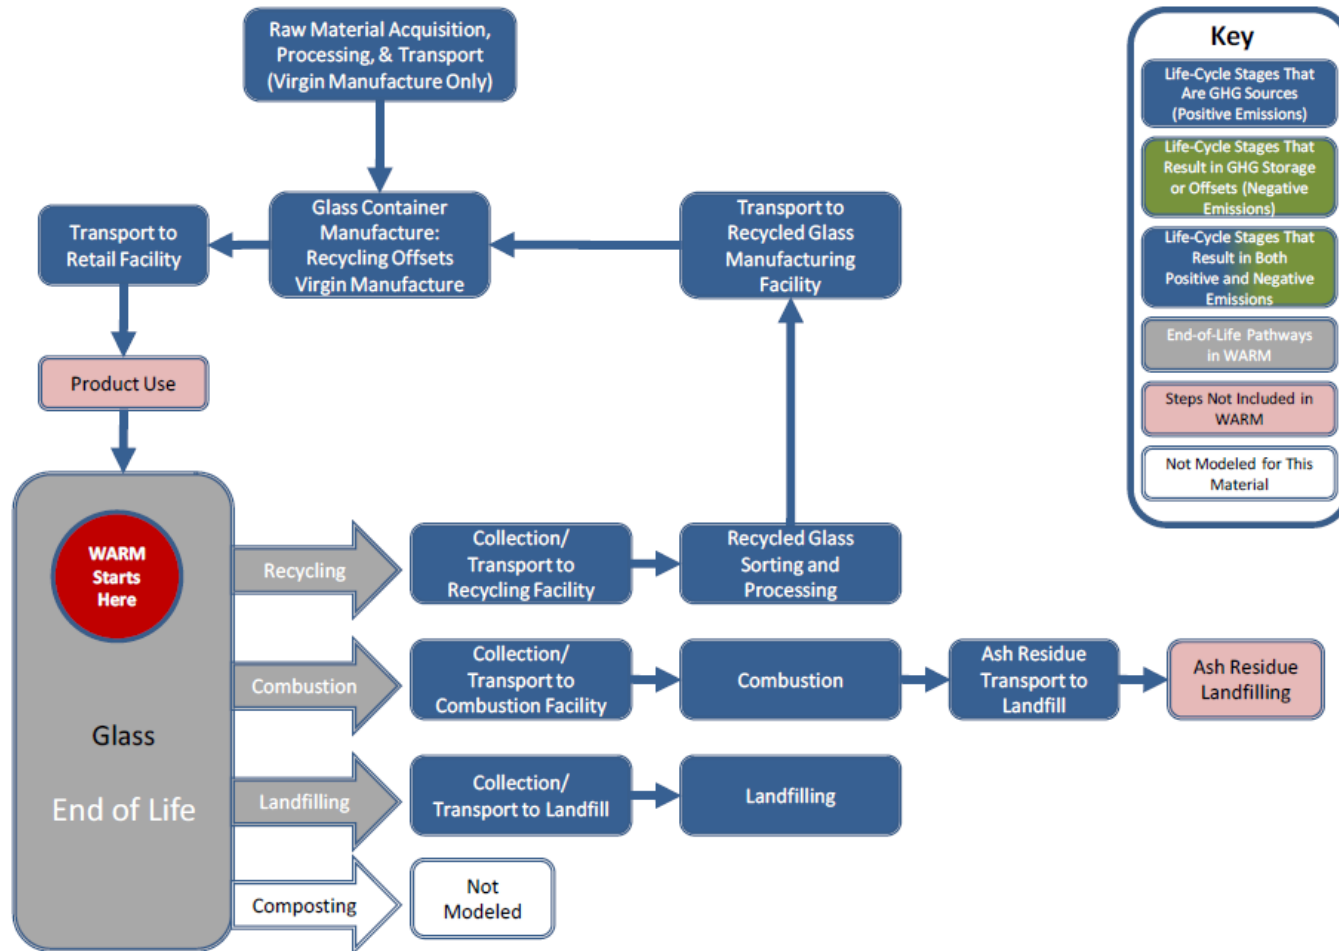

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

Pathway-specific modeling

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

WARM – recent revisions

- last updated February 2012 (Version 12)
- Added LLDPE, PP, PS, PVC, & PLA & aluminum ingot
- Revised
 - EFs for aluminum cans
 - combustion and open-loop recycling pathways for residential broadloom carpeting
 - EFs for HDPE, LDPE & PET
 - Recycling factors for mixed recycling and mixed plastics recycling factors

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

The Future of WARM – Organics

- we have begun work on modeling 5 categories of food waste throughout their lifecycle.
 - chicken, beef, dairy, grains, and fruits/vegetables
- we hope to add food donation as well as source reduction as two new waste management scenarios in WARM for organics

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

The Future of WARM – Electronics

- Currently, WARM considers only one electronics category – a 70 lb desktop computer
- In FY13, we will be looking at utilizing the Electronics Environmental Benefits Calculator (EEBC) in lieu of WARM, and whether any additions/changes would need to be made to the EEBC to help better align the two.

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

The Future of WARM – Landfill Gas

- We are examining three aspects of landfill gas collection modeling in WARM:
 - (1) the fraction of produced gas that is either collected or attenuated by methane oxidation,
 - (2) the timing of gas collection system installation, and
 - (3) the time over which a beneficial use system can be expected to function in consideration of the volume of recoverable gas available.

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

iWARM

- Downloadable Excel spreadsheet or iPhone app
- Uses data from WARM, translated from tons to weight of individual products
- Estimates the amount of energy saved by recycling small quantities of common waste materials
- Benefit is shown as the operational hours of common appliances.

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

Individual Waste Reduction Model (iWARM)

1. Inputs

Enter the number of items of each product type you will be recycling in the column on the right

Product Type	Number of Items	Clear All
Aluminum drink can (12 fl. oz.)	12	
Steel soup can (15.5 fl. oz.)		
Metal coat hanger		
Glass bottle (12 fl. oz.)		
Glass wine bottle (0.75 liter)		
Gallon plastic milk jug		
Gallon plastic detergent container		
Plastic grocery bag		
Plastic bottle (20 fl. oz.)		
Plastic bottle (2 liter)		
2' x 2' x 2.5' corrugated cardboard box, 3mm thick		
Weekly magazine		
Catalog		
Daily newspaper		
Sunday edition of newspaper		
12-inch stack of newspaper		
Printer paper, 1 ream (500 sheets)		
Sheet of printer paper		
White business envelope		
Paperboard cereal box		

Important Assumptions

- Net energy savings are the result of recycling a product instead of landfilling it. EPA recognizes that not all products that are disposed are sent to a landfill. According to EPA's MSW Facts and Figures report, approximately 80% of all waste disposed is landfilled and the remaining 20% is combusted. The benefits of recycling as compared to combustion would be different than those presented here. However, since the majority of waste disposed is landfilled, this assumption is representative of the main disposal pathway in the United States.
- The recycled product is assumed to be manufactured using 100% recycled inputs, and to displace the manufacture of a product made with 100% virgin inputs. EPA recognizes that products that are recycled generally displace new materials that have a mixture of recycled and virgin inputs (i.e., current average industry mix). The benefits presented here may be overstated for some materials, e.g., aluminum cans, for which the current average industry mix includes a high percentage of recycled inputs.
- All the upstream energy saved via recycling is described in terms of delivered electricity energy downstream. In other words, the energy content of all fuels saved in the production process is expressed in terms of delivered electricity energy equivalent. The delivered electricity equivalent incorporates transmission and distribution losses.
- The hours equivalencies for appliances are not additive and indicate the hours available to operate ONE appliance on the list at a time. The graph shows the comparison of hours available based on typical wattage of an appliance during operation.

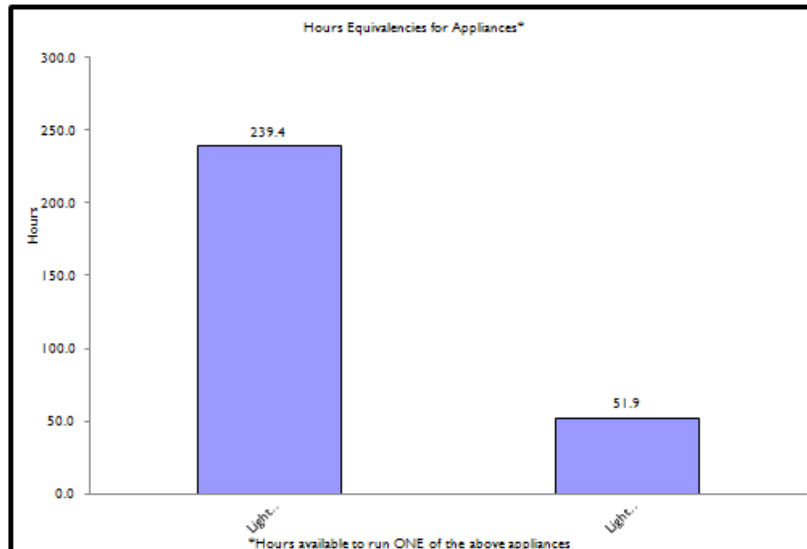

2. Results

3. The energy saved by recycling these products is equal to the electricity required to run ONE of the following appliances for the indicated number of hours:

Click on individual checkboxes to graph the hours equivalent for a particular appliance

Appliance	Hours Available	Appliance	Hours Available
<input type="checkbox"/> Select All			
<input type="checkbox"/> Room Air Conditioner	2.1	<input type="checkbox"/> Dishwasher (w/dry cycle)	1.3
<input type="checkbox"/> Ceiling Fan	25.9	<input type="checkbox"/> Dishwasher (w/o dry cycle)	2.6
<input type="checkbox"/> Window Fan	20.4	<input checked="" type="checkbox"/> Light bulb, CFL (60 W equivalent)	239.4
<input type="checkbox"/> Hairdryer	2.0	<input checked="" type="checkbox"/> Light bulb, Incandescent (60 W)	51.9
<input type="checkbox"/> Clothes Dryer	0.9	<input type="checkbox"/> Laptop Computer	62.2
<input type="checkbox"/> Clothes Washer	7.3	<input type="checkbox"/> CRT Television, 36"	23.4

ReCon

- The ReCon Tool was last updated October 2010.
- Web-based and Excel (downloadable)
- 17 material types
- Baseline and alternative recycled content scenarios
- GHG (MTCO₂e) and energy (mBTUs)

CHANGING HOW WE THINK ABOUT OUR RESOURCES FOR A BETTER TOMORROW

Material Purchased	Surrogate Material	Baseline Recycled Content (percent)	Alternate Recycled Content (percent)	Use Default for Baseline Recycled Content <small>[set all]</small>	Recycled Content Range (percent)

Greenhouse Gas Equivalency Calculator

Equivalency Results

Click on the question mark ? link to read the explanation of that particular calculation. [Read about all calculations.](#)

The information you entered above is equivalent to one of the following statements:

Annual greenhouse gas emissions from passenger vehicles ? *(click to read more about this calculation)*

CO₂ emissions from gallons of gasoline consumed ?

CO₂ emissions from barrels of oil consumed ?

CO₂ emissions from tanker trucks' worth of gasoline ?

CO₂ emissions from the *electricity* use of homes for one year ?

CO₂ emissions from the *energy* use of homes for one year ?

Carbon sequestered by tree seedlings grown for 10 years ?

Carbon sequestered annually by acres of U.S. forests ?

Carbon sequestered annually by acres of U.S. forest preserved from conversion to cropland ?

CO₂ emissions from propane cylinders used for home barbeques ?

CO₂ emissions from burning railcars' worth of coal ?

Greenhouse gas emissions avoided by recycling tons of waste instead of sending it to the landfill ?

Annual CO₂ emissions of coal fired power plants ?

The logo consists of the lowercase letters 'nk' in a bold, blue, sans-serif font. The 'n' and 'k' are connected at the top.
