³Virginia Tech

Background

- **Sanitary Sewer Overflow Consent Decree**
- **Negotiated over several years, entered in Court December 2005**
- **Water Quality Monitoring Plan**
 - **Total bacteria**
 - **Bacterial source tracking : an emerging technology**
- **WSSC commissioned “White Paper” to identify state-of-the-art BST technologies**

Consent Decree

- **No guidance or rationale for:**
 - Selection of sampling points
 - Stream flow conditions
 - Analytical methods
 - Criterion for expected reduction in human source bacteria following collection system repair, rehabilitation, or replacement

WQM Plan

- **Monitoring scope:**
 - 26 sewer basins (annual sampling)
 - Semi-annual sampling (20 sewer basins)
- **Prepared by EA Engineering:**
 - Selected BOX-PCR for MST analyses
 - Identified sampling stations, stream flow criterion
- **Quarterly reporting format:**
 - Alphabetical by sewer basin name
 - Data in columns for BST and total bacteria values

WQM Implementation

- **Underway since March 2007**
 - Voluntary quarterly sampling in selected Anacostia River sewer basins 2007–2011 (→ not statistically different)
 - Added MST “toolbox” tests: fluorescence, human bacteroides HF183
- **Nine years of data (thru March 2015):**
 - No mandate to evaluate findings or trends
 - EA Engineering prepared two data reports
 - Sewer system rehab. completed in 2 basins, still underway in others

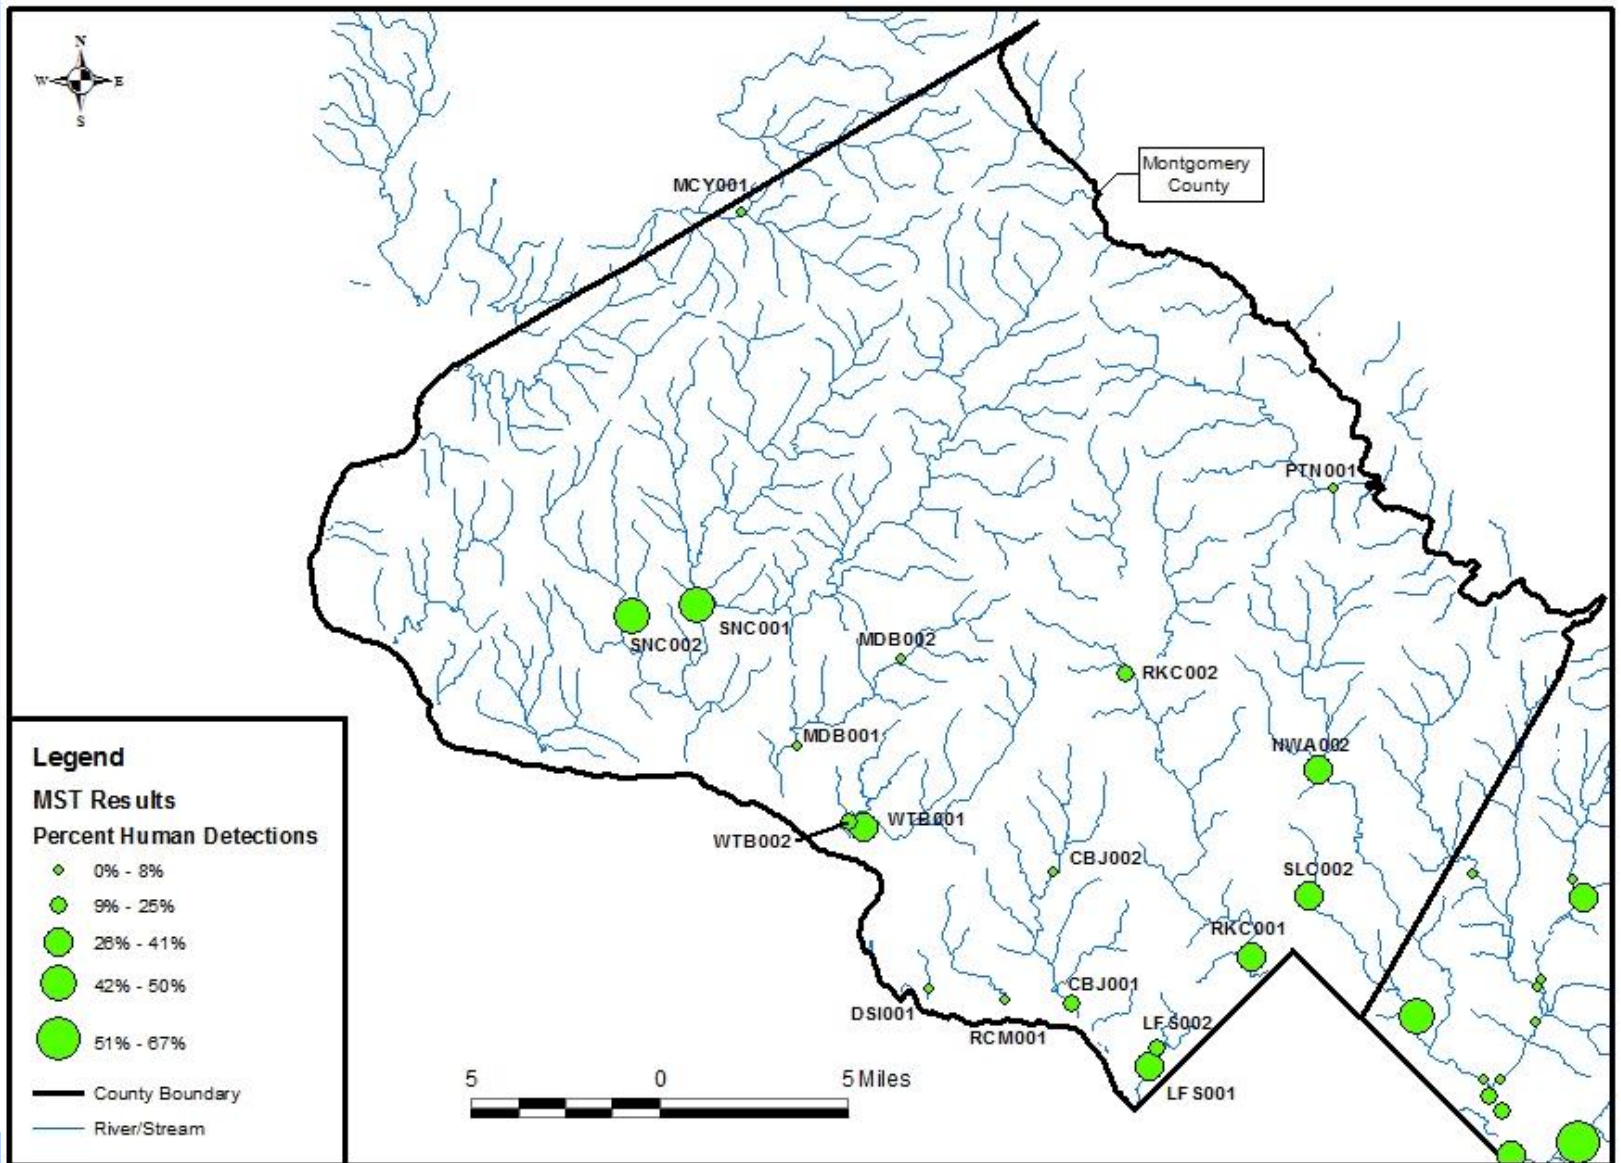

Strong Seasonality

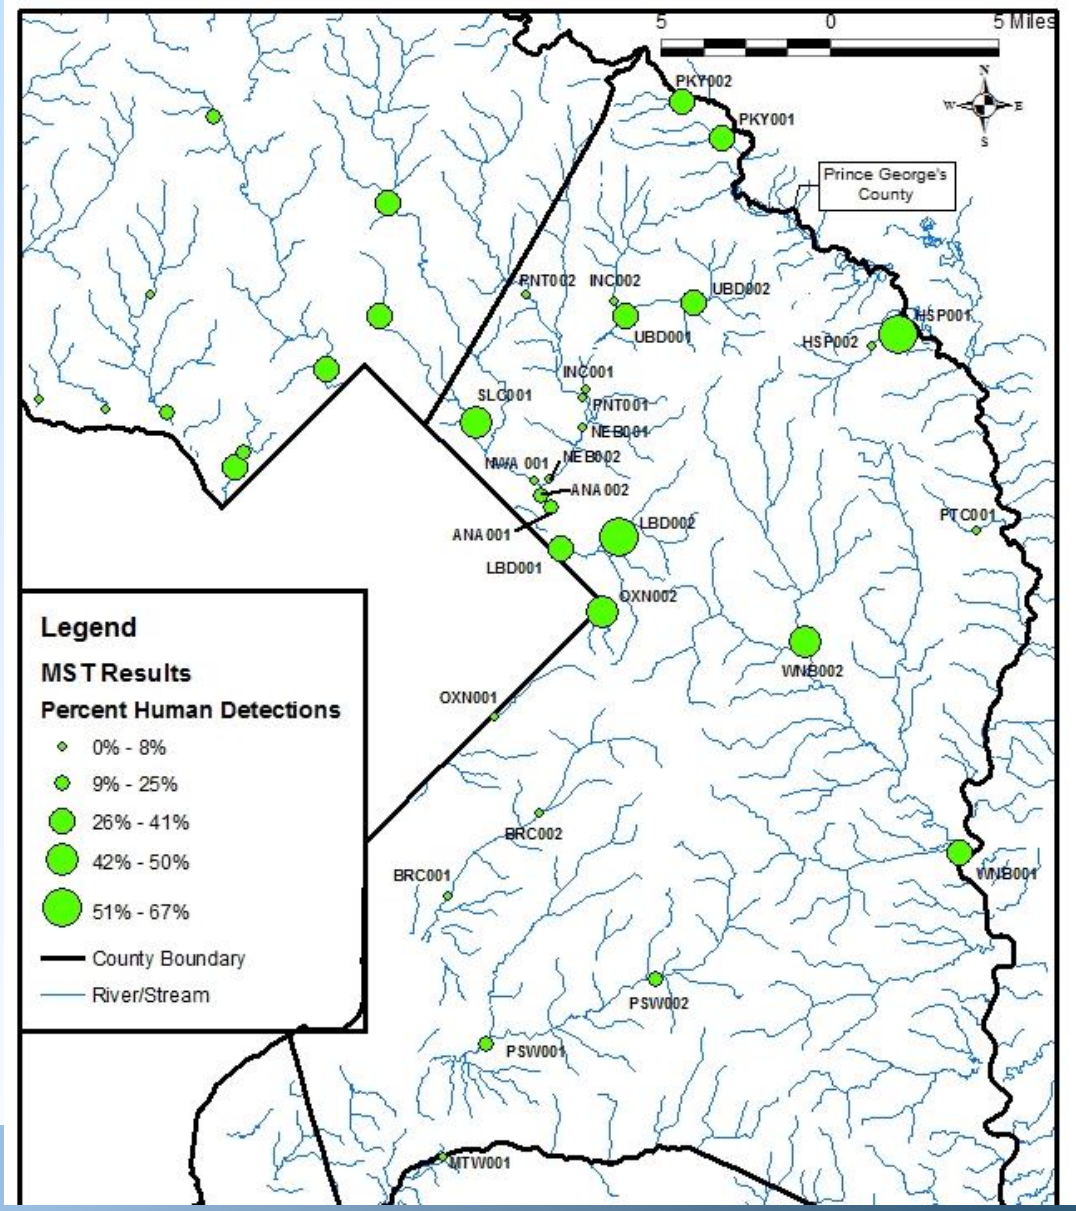

Average Percent Source Contributions of Fecal Bacteria in Surface Waters of Prince George's County and Montgomery County

Human Detections – Montgomery County

Human Detections – Prince George's County

Average Seasonal Source Allocations

MDE's BST Study in Anacostia River Watershed

10

- **MDE conducted surface water sampling at 6 stations in 2002/2003**
 - **WSSC collects data at same locations**
- **Samples collected monthly for period of 1 year**
 - **Mix of low flow and high flow conditions**
- **BST conducted using Antibiotic Resistance Analysis (ARA) by Salisbury University**
- **BST results used for TMDL Allocations**

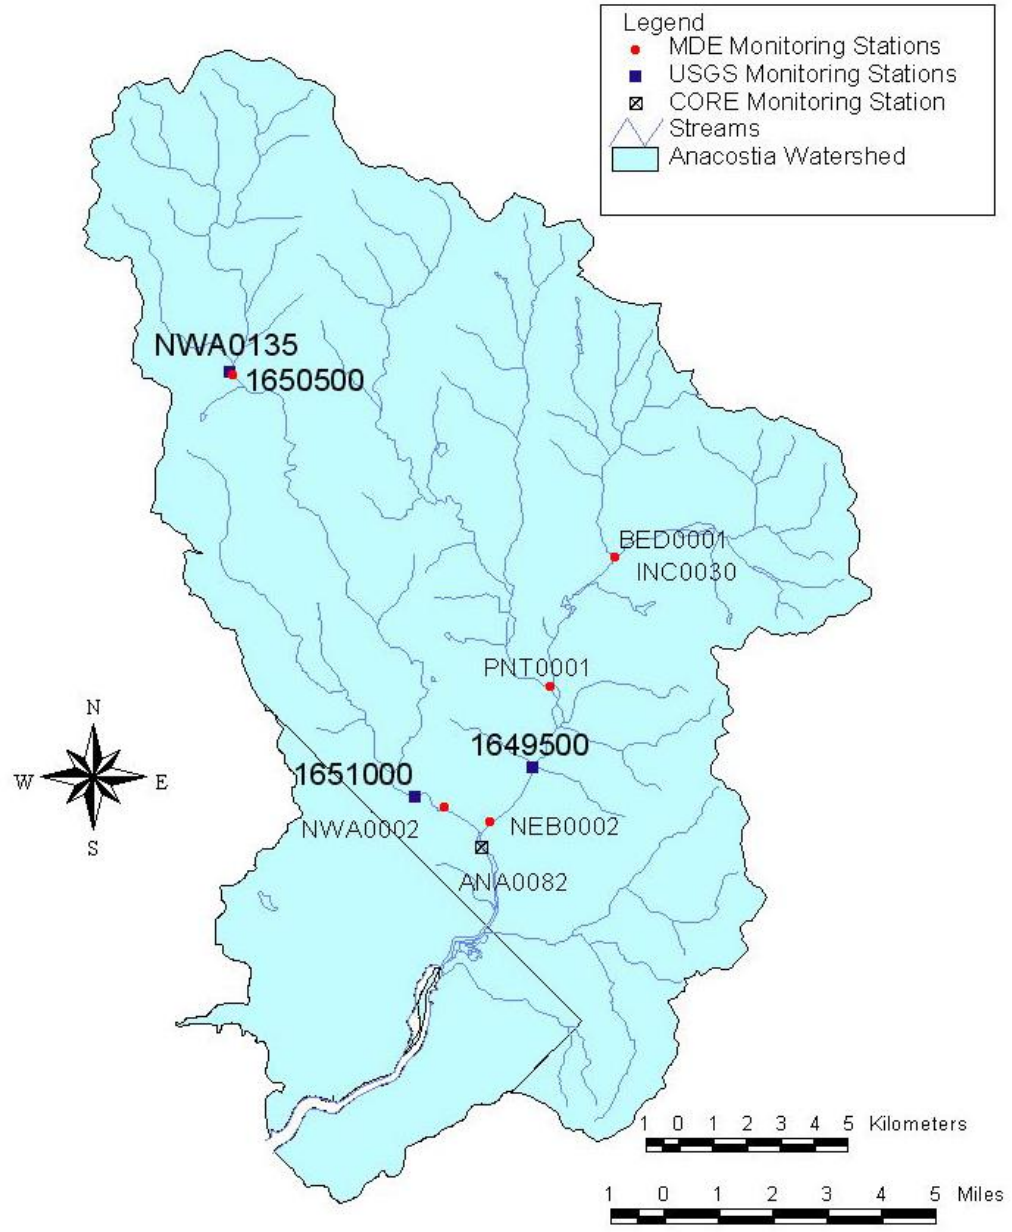

MDE's BST in Anacostia River Watershed

11

- **Source Categories:**

- Human
- Domestic Animal = dog
- Livestock = horse, pig, goat, sheep, chicken, cow
- Wildlife = goose, deer, rabbit, fox
- Unknown

TMDL Reduction Targets

Maximum Practicable Reduction Targets

Human	Domestic	Livestock	Wildlife
95%	75%	75%	0%

TMDL Reduction Targets

Station	% Domestic Animals	% Human	% Livestock	% Wildlife	% Target Reduction
BED0001	98%	98%	98%	81%	91%
INC0030	98%	98%	98%	66%	88%
PNT0001	98%	98%	98%	72%	87%
NEB0002sub	98%	95%	98%	49%	79%
NWA0135	98%	98%	98%	14%	88%
NWA0002sub	98%	98%	98%	53%	78%

Conclusions

- **Often unreasonable to reduce non-human microbial loads by 90% as required in some MS4 permits**
 - **Stormwater BMPs have limited/contradictory data on bacterial reduction**
- **The ARA Method used by MDE to develop load allocations likely underestimates wildlife contributions**
- **Genetic-based MST methods have replaced ARA, and have become reasonably inexpensive**
- **Counties with fecal bacteria TMDLs could benefit from MST by better characterizing human versus non-human sources**

Questions?

3.2: DC Final Average Bacteria Source Distribution for Anacostia Waterway at the Confluence of the NWB and NEB Confluence and Upstream of the Maryland/D

Source Category	Domestic Animals	Human	Livestock	Wildlife	Total
%	21.1%	22.2%	0.3%	56.5%	100.0
