## National Capital Region Transportation Planning Board

777 North Capitol Street, N.E., Suite 300, Washington, D.C. 20002-4290 (202) 962-3310 Fax: (202) 962-3202

#### Memorandum

November 16, 2005

То:	Transportation Planning Board
From:	Michael J. Clifford Systems Planning Applications Director
Subject:	Draft Results of the Fine Particles Standards (PM2.5) Air Quality Conformity Assessment of the 2005 Constrained Long Range Plan (CLRP) and the FY2006- 2011 Transportation Improvement Program (TIP)

#### Introduction

This memo transmits draft summary results of the fine particles (PM2.5) air quality conformity assessment of the 2005 CLRP and the FY2006-2011 TIP (full report is attached). While the CLRP and TIP were subject to an air quality conformity assessment which was approved by the TPB on October 19, 2005, that assessment reflected requirements associated with the 8-hour ozone and Wintertime carbon monoxide standards. On December 17, 2004 EPA designated the Washington, DC-MD-VA area as nonattainment for the PM2.5 standards. On April 5, 2005 EPA published the final set of rules for transportation conformity associated with the new standards (complementing an initial set of conformity rule amendments published on July 1, 2004). EPA requirements include that the TPB demonstrate conformity to the new rule by April 5, 2006 or face a conformity lapse, i.e., limitations on transportation projects which may proceed toward implementation. These additional requirements, which became effective while the 8-hour conformity assessment was in progress, led to this supplemental air quality analysis of the plan and program.

#### Methods

The scope of work for this analysis, approved by the TPB at its July 20, 2005 meeting, identified methods to address the new PM2.5 requirements which are consistent with the 8-hour air quality assessment. Work tasks utilize the latest models and methods, i.e., COG's Round 7.0 Cooperative Forecasts, TPB's Version 2.1D #50 travel demand model, and EPA's Mobile6.2 emissions factor model.

Conformity assessment criteria for the PM2.5 standards provided in EPA's July 1, 2004 transportation conformity rule amendments include a demonstration that PM2.5 emissions (including both direct PM2.5 and NOx precursors) for each analysis year of the CLRP and TIP are not greater than base year 2002 emissions. EPA has provided these criteria for use during an interim period which will continue only until state air quality implementation plan (SIP) activities determine emissions reduction requirements to attain the fine particles standards, and establish new mobile emissions budgets for inclusion in the air quality plans for meeting the standards.

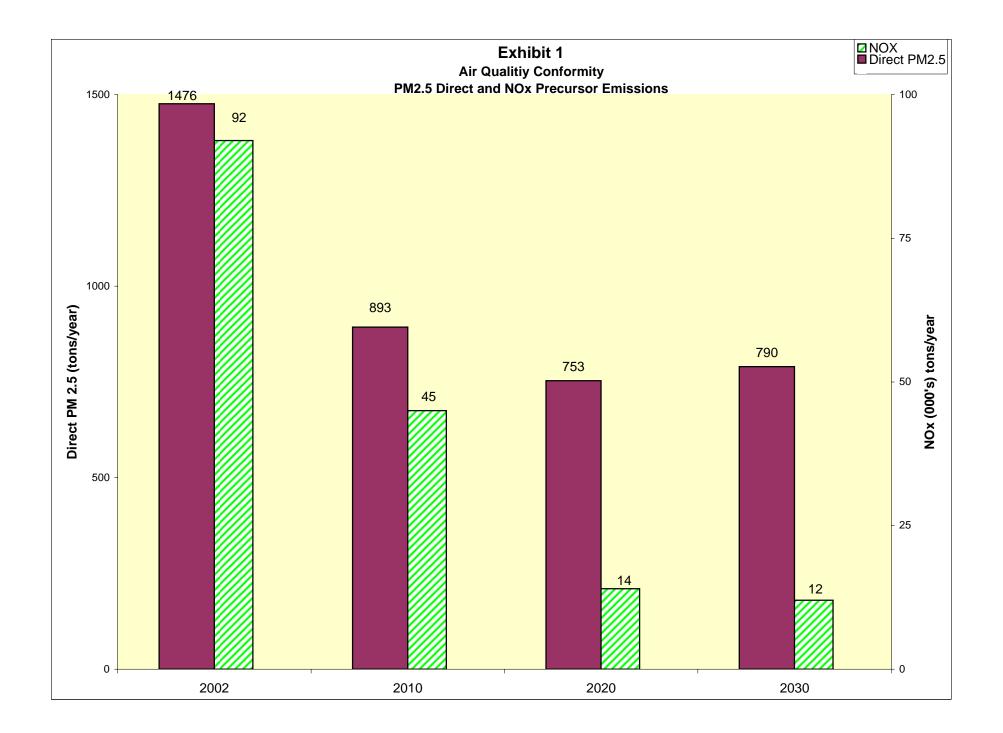

#### Results

The PM2.5 conformity assessment includes the estimation of direct PM2.5 and NOx precursor emissions for the 2002, 2010, 2020 and 2030 analysis years. The following exhibit presents these emissions for each milestone year. The exhibit shows that mobile emissions are well below the 2002 base year levels for each pollutant. Therefore, the analytical results described in this air quality assessment provide a basis for a determination by the TPB of conformity of the 2005 CLRP and the FY2006-2011 TIP with respect to fine particle standards.

#### **Next Steps**

These results are provided for release today for 30 day public comment and interagency consultation. Following receipt of and response to comments, TPB approval action is scheduled for December 21, 2005. This schedule has been established to provide federal agencies with sufficient time to conduct their review and approval process in advance of the conformity lapse deadline of April 5, 2006.

Following: Exhibit Attached report

## FINE PARTICLES (PM 2.5) STANDARDS AIR QUALITY CONFORMITY ASSESSMENT

Supplement to the Air Quality Conformity Assessment of the 2005 Constrained Long Range Plan Amendments and FY2006-2011 Transportation Improvement Program

November 16, 2005

The preparation of this report was financially aided through grants from the District of Columbia Department of Transportation, the Maryland Department of Transportation, the Virginia Department of Rail & Public Transportation, the Virginia Department of Transportation, Federal Highway Administration, and the U.S. Department of Transportation, Federal Transit Administration, under the Urban Mass Transportation Act of 1964, as amended.

#### I. INTRODUCTION

This report documents the results of the fine particles (PM2.5) standards air quality conformity assessment of the 2005 Constrained Long Range Plan (CLRP) and the FY2006-2011 Transportation Improvement Program (TIP). This supplements the technical report, Air Quality Conformity Determination Of The 2005 Constrained Long Range Plan And The FY2006-2011 Transportation Improvement Program For The Washington Metropolitan Region (October 19, 2005), which addressed carbon monoxide and the 8-hour ozone standard. As assessment criteria for the fine particles standards include the analysis of the same milestone years previously analyzed for the ozone and carbon monoxide standards (2002, 2010, 2020 and 2030), travel demand technical methods and results developed in that earlier work are applied directly to this analysis. Major differences associated with the fine particles conformity assessment include estimation of direct PM2.5 emissions and NOx precursor emissions, for a revised nonattainment geography (see Figure 1), on a yearly, instead of daily, basis. Tasks for this supplemental analysis included: translation of the previously reported annual average weekday travel (AAWDT) estimates into average daily (ADT) values by season, estimation of environmental inputs and PM2.5 direct and NOx precursor emissions rate outputs for each season, the subsequent calculation of emissions for each season, and tabulation to yearly totals.

#### **II. BACKGROUND**

On December 17, 2004 the Environmental Protection Agency (EPA) designated 224 counties, as well as the District of Columbia, that exceeded the health-based standards for fine particles (PM2.5) as nonattainment areas. PM2.5 standards refer to particulate matter less than or equal to 2.5 micrometers in diameter. The Washington, DC-MD-VA area (consisting of the Washington metropolitan statistical area, excluding Stafford County, Virginia, and Calvert County, Maryland) was designated nonattainment for PM2.5 (see map), and is required to attain clean air as soon as possible but no later than 2010.

As published in the January 5, 2005 Federal Register, these PM2.5 nonattainment designations became effective on April 5, 2005. Nonattainment areas are required by early 2008 to submit to EPA a state implementation plan (SIP) to define the expected methods for reducing the fine particulate matter level in the air and emissions of PM2.5 precursors. However, the new standards affect transportation conformity planning requirements immediately: areas have a 1 year grace period starting April 5, 2005 in which to demonstrate conformity of transportation plans and programs to the new standards. If a plan or TIP which conforms to the new standards is not in place (including both TPB and federal approvals) by April 5, 2006, the conformity status lapses.

Since EPA had not issued its necessary second set of PM2.5 transportation conformity regulations at the time of the TPB's annual plan / program update cycle, staff prepared a draft work scope for the air quality conformity assessment of the 2005 CLRP and FY2006-2011 TIP, to address only ozone season and winter carbon monoxide requirements. This scope was released for public comment in February and adopted by the TPB at its April 20, 2005 meeting. This timing required TPB staff to prepare a "supplemental" scope of work (Attachment A) for the PM2.5 component of the conformity assessment of the 2005 CLRP and FY2006 – 11 TIP. The TPB released that scope of work for public comment on June 15, 2005, and approved it along with response to comment at its July 20, 2005 meeting. This report documents the results of

performing those work activities and the air quality conformity findings.

#### **III. WORK ACTIVITIES**

Technical work activities for the supplemental conformity assessment of the 2005 CLRP and FY2006-2011 TIP included the preparation of direct PM2.5 and nitrogen oxide (NOx) precursor emissions inventories for the 2002, 2010, 2020, and 2030 analysis years. This involved use of the following technical inputs: Round 7.0 Cooperative Forecasts; the Version 2.1D Travel Demand Model utilizing this year's project submissions to the CLRP and TIP; EPA's Mobile6.2 Emissions Factor Model; and a refined Mobile Emissions Post-Processor using latest travel demand and mobile emissions planning assumptions. This report presents the results of the supplemental conformity analysis, as follows.

#### **Travel Modeling Process**

The travel demand estimation for AAWDT prepared in the ozone / carbon monoxide conformity assessment provided the starting point for this work. However, since estimates of <u>annual</u> travel and emissions are required for fine particles assessment, the application of seasonal travel adjustment factors was therefore required. Since seasonal travel totals have to include weekend travel as well as weekday travel, staff prepared adjustment factors to represent ADT occurring in each season of the year. The upper table in Exhibit 1 shows the AWDT VMT estimates for the PM2.5 nonattainment area for each of the analysis years; the lower table presents the seasonal adjustment factor necessary to develop ADT VMT for each season.

#### **Emissions Factors**

COG/TPB staff, in conjunction with COG Department of Environmental Programs staff and with the consultant assistance of E.H. Pechan and Associates, developed the PM2.5 direct and NOx precursor motor vehicle emissions factors through the use of EPA's Mobile6.2 emissions factor model. The development of these factors involved interaction with MWAQC's Technical Advisory Committee and its Emissions Inventory Work Group, in a series of meetings and conference calls over the August to October time period, to finalize the emissions factor modeling approach and to develop the necessary environmental inputs to EPA's Mobile6.2 emissions factor model. The basic approach, which initially considered application of hourly inputs of temperature and humidity, involved the use of seasonal average daily minimum / maximum temperatures and associated default humidity values.

Similarly, data periods of analysis under consideration included annual, seasonal and monthly. After a lengthy effort involving tests of different levels of aggregation, including task orders to TPB's consultant to modify the existing software which provides an interface between the Mobile model and TPB's emissions calculation software, it was finally decided to conduct the emissions factor analysis on a seasonal basis, consistent with the travel demand approach. Environmental data inputs to the modeling process are shown in Exhibit 2 for the 2002 and 2010 analysis years.

Exhibit 3 presents Mobile model output emissions rates for direct PM2.5, using District of Columbia data as an illustration. This table shows the component pollutants and rates, as well as

the total PM2.5 rates for 2002. Exhibit 4 shows how direct PM2.5 rates vary through time, as well as by season of the year. While Winter rates are noticeably higher than the other seasons, the rates show a significant decrease through time, primarily due to the impacts of having cleaner vehicles in the fleet. These gram / mile rates are shown in a bar chart, unlike the familiar line graphs seen with NOx, since they do not vary by vehicle speed.

Exhibit 5 shows NOx precursor rates through time; these steep reductions in emissions rates in the future are similar to the trends seen with direct PM2.5 and in previous analyses of NOx as a precursor pollutant to ozone. Exhibit 6 shows NOx precursor rates by season, which exhibit similar characteristics to direct PM2.5, i.e., higher Winter season rates.

#### **Emissions Calculations**

Emissions calculations are performed in a software package called the emissions 'postprocessor', which was modified by TPB staff to accommodate the new PM2.5 pollutants and geography, utilizing the seasonal approach. Once travel demand and emissions factors were developed they were applied in the emissions postprocessor to yield the direct PM2.5 emissions and precursor emissions, shown in Exhibits 7 and 8, respectively. Arrayed to show values by travel component, by season, through time and yearly totals, the tables indicate dramatic reductions through time in each component of travel. Emissions are also seen to vary by season, according to VMT changes and emissions factor changes occurring throughout the year. Documentation of the emissions calculations for each of these travel components is contained in Attachments C - E.

#### **IV. EMISSIONS ANALYSES**

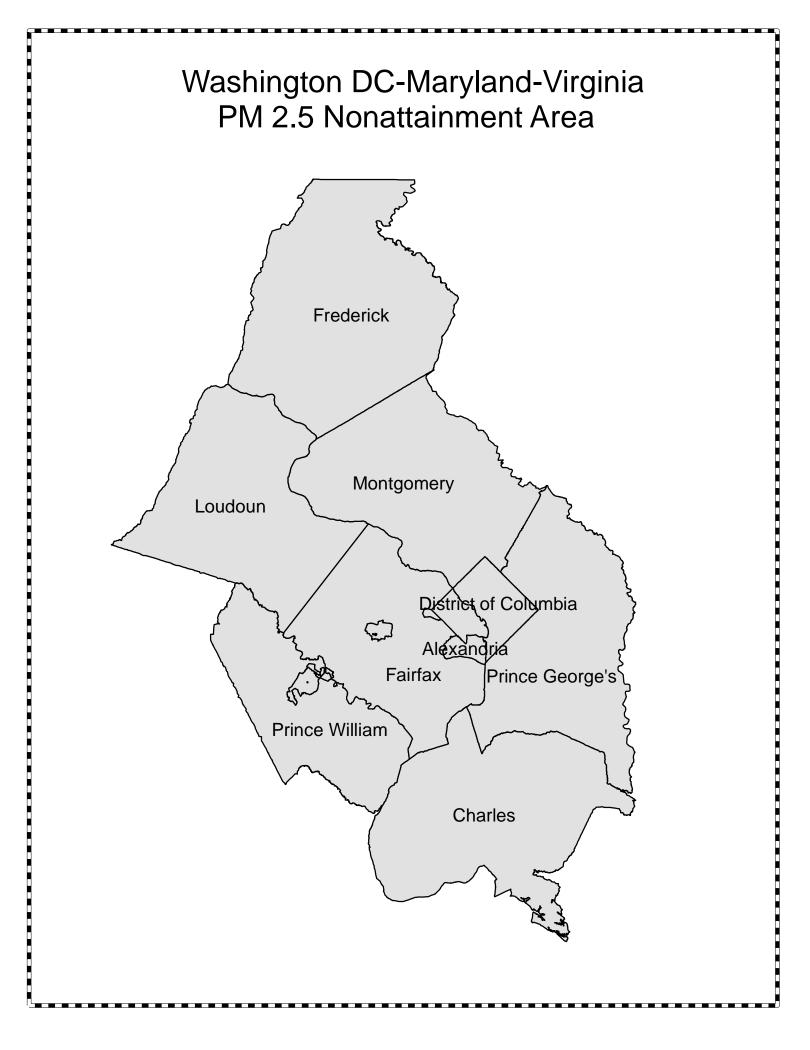

As there are no mobile source emissions budgets for fine particles at this point, the relevant emissions test is that direct PM2.5 and NOx precursor emissions in each plan and program action scenario (forecast year) are not greater than base year 2002 emissions. As shown in the Exhibits 7 and 8 summary tables and graphically in Exhibit 9, this criterion is met handily for each analysis year.

#### V. SUMMARY

This report documents the technical methods and results of plan and program conformity analysis with respect to the fine particles standards. The analytical results described in this air quality assessment provide a basis for a determination by the TPB of conformity of the 2005 CLRP and the FY2006-2011 TIP, with the July 2004 and May 2005 transportation conformity regulations, and all other requirements of the Clean Air Act Amendments of 1990.

#### FINE PARTICLES (PM2.5) STANDARDS AIR QUALITY CONFORMITY ASSESSMENT

#### **SCOPE OF WORK**

#### Supplement to the Air Quality Conformity Assessment of the 2005 Constrained Long Range Plan Amendments and FY2006-2011 Transportation Improvement Program

#### I. INTRODUCTION

On December 17, 2004 the Environmental Protection Agency (EPA) designated 224 counties, as well as the District of Columbia, that exceeded the health-based standards for fine particles (PM2.5) as nonattainment areas. PM2.5 standards refer to particulate matter less than or equal to 2.5 micrometers in diameter. The Washington, DC-MD-VA area (consisting of the Washington metropolitan statistical area, excluding Stafford County, Virginia, and Calvert County, Maryland) was designated nonattainment for PM2.5 and is required to attain clean air as soon as possible but no later than 2010.

As published in the January 5, 2005 Federal Register, these PM2.5 nonattainment designations became effective on April 5, 2005. Nonattainment areas are required by early 2008 to submit to EPA a state implementation plan (SIP) to define the expected methods for reducing the fine particulate matter level in the air and emissions of PM2.5 precursors. However, the new standards affect transportation conformity planning requirements immediately: areas have a one year grace period starting April 5, 2005 in which to demonstrate conformity of transportation plans and programs to the new standards. If a plan and TIP which conform to the new standards are not in place (including both TPB and federal approvals) by April 6, 2006, the conformity status lapses.

This scope of work presents an outline of the work tasks, including preparation of both direct particles and precursors, to address the conformity requirements of the fine particles standards. It supplements the ongoing TPB work activities directed at the 8-hour ozone and Winter carbon monoxide (CO) standards, to ensure that all requirements are addressed in performing the Air Quality Conformity Assessment of the 2005 CLRP and FY2006-2011 TIP.

#### II. REQUIREMENTS AND APPROACH

#### **A. Criteria** (See Exhibit 1)

As described in the 1990 Clean Air Act Amendments, conformity is demonstrated if transportation plans and programs:

- 1. Are consistent with most recent estimates of mobile source emissions,
- 2. Provide expeditious implementation of TCMs, and
- 3. Contribute to annual emissions reductions.

#### B. Approach

- 1. Analytical: The analytical approach outlined here supplements the current conformity assessment efforts underway to analyze the 2005 CLRP and FY2006-2011 TIP with respect to 8-hour ozone and Winter CO standards. Specifically, travel demand estimates for each analysis year being prepared as part of that work will be utilized in conjunction with the development and application of PM2.5 emissions rates to yield required PM2.5 emissions levels. (I.E. Round 7 Cooperative Forecasts, and all network inputs and technical methods approved by the TPB at its April 20, 2005 meeting, are therefore relevant to this PM2.5 analysis.) Emissions will be inventoried for yearly totals instead of on a daily basis.
- 2. Evaluation: Criteria and procedures for demonstrating conformity with respect to PM2.5 in the interim period before state implementation plans (SIPs) are filed differ from ozone or wintertime carbon monoxide assessments in that there are no existing budgets which can be applied. In a case such as this EPA provides two options for regional emissions analysis to be used until motor vehicle emissions budgets are established in the SIP. For both PM2.5 directly emitted particles and precursors, one of the following requirements must be met:

Option 1. "The emissions predicted in the "Action" scenario are not greater than the emissions predicted in the "Baseline" scenario, and this can be reasonably expected to be true in the periods between the analysis years; or

Option 2. The emissions predicted in the "Action" scenario are not greater than 2002 emissions."

A SIP has not yet been prepared to inventory point, area and mobile categories to define the extent of the problem by source in the Washington area. However, since base year 2002 on-road mobile source direct and precursor PM2.5 emissions are necessary for the SIP, it is recommended that option 2, reductions from the base 2002 inventory, be utilized as the relevant regional emissions test for conformity. The MOBILE6.2 model will be used to generate emissions factors for PM2.5 direct particles and NOx precursors.

#### III. CONSULTATION

- 1. Execute TPB consultation procedures as outlined in the consultation procedures report adopted by the TPB on May 20, 1998.
- 2. Participate in meetings of MWAQC, its Technical Advisory Committee and its Conformity Subcommittee to discuss the scope of work activities, TERM development process, and other elements as needed; discuss at TPB meetings or forums, as needed, the following milestones:
  - Project solicitation
  - Scope of work
  - TERM proposals
  - Project submissions: documentation and comments
  - Analysis of TERMs, list of mitigation measures
  - Conformity assessment: documentation and comments
  - Process: comments and responses

#### IV. WORK TASKS

- 1. Prepare 2002 base conditions
  - Develop and apply Mobile6.2 emission factors for PM2.5 direct particles and NOx precursors
  - Calculate yearly (not daily) emissions for total PM2.5 and NOx precursors using latest seasonal traffic adjustments
- 2. Prepare 2010 emissions estimates
  - Develop and apply Mobile6.2 emission factors
  - Calculate emissions as above
- 3. Prepare 2020 emissions estimates
  - As in year 2010 tasks
- 4. Prepare 2030 emissions estimates
  - As in year 2010 tasks
- 5. Analyze results of above technical analysis

- Reductions from 2002 base
- With review by the Travel Management Subcommittee, the Technical Committee and the TPB, identify and recommend additional measures should the plan or program fail the regional emissions test in any year and incorporate
- 6. Assess conformity and document results in a report
  - Document methods
  - Draft conformity report
  - Forward to technical committees and policy committees
  - Make available for public and interagency consultation
  - Receive comments
  - Address comments and present to TPB for action
  - Finalize report and forward to FHWA and FTA

#### V. SCHEDULE

The schedule for the execution of these work activities is shown in Exhibit 2, attached. This schedule shows the adoption of the PM2.5 conformity determination by the TPB in October 2005, which allows sufficient time for distribution, review and final approval by federal agencies in order to meet the April 5, 2006 deadline for avoiding a conformity lapse.

## Exhibit 1

#### Conformity Criteria

Sec. 93.110 Latest planning assumptions. Sec. 93.111 Latest emissions model. Sec. 93.112 Consultation. Transportation Plan: Sec. 93.113(b) TCMs. Sec. 93.118 or Sec. 93.119 Emissions budget or Emission reduction. TIP: Sec. 93.113(c) TCMs. Sec. 93.118 or Sec. 93.119 Emissions budget or Emission reduction. Project (From a Conforming Plan and TIP): Sec. 93.114 Currently conforming plan and TIP. Project from a conforming plan and TIP. Sec. 93.115 CO and PM10 hot spots. Sec. 93.116 PM10 control measures. Sec. 93.117 Project (Not From a Conforming Plan and TIP): Sec. 93.113(d) TCMs. Sec. 93.114 Currently conforming plan and TIP. Sec. 93.116 CO and PM10 hot spots. Sec. 93.117 PM10 control measures. Sec. 93.119 Interim emissions in areas without motor vehicle emissions budgets

#### Sec. 93.110 Criteria and procedures: Latest planning assumptions.

The conformity determination must be based upon the most recent planning assumptions in force at the time of the conformity determination.

#### Sec. 93.111 Criteria and procedures: Latest emissions model.

The conformity determination must be based on the latest emission estimation model available.

#### Sec. 93.112 Criteria and procedures: Consultation.

All Actions at all times:

Conformity must be determined according to the consultation procedures in this subpart and in the applicable implementation plan, and according to the public involvement procedures established in compliance with 23 CFR part 450.

#### Sec. 93.113 Criteria and procedures: Timely implementation of TCMs.

The transportation plan, TIP, or any FHWA/FTA project which is not from a conforming plan and TIP must provide for the timely implementation of TCMs from the applicable implementation plan.

#### Sec. 93.114 Criteria and procedures: Currently conforming transportation plan and TIP.

There must be a currently conforming transportation plan and currently conforming TIP at the time of project approval.

#### Sec. 93.115 Criteria and procedures: Projects from a plan and TIP.

The project must come from a conforming plan and program.

#### Sec. 93.116 Criteria and procedures: Localized CO and PM10 violations (hot spots).

The FHWA/FTA project must not cause or contribute to any new localized CO or PM10 violations or increase the frequency or severity of any existing CO or PM10 violations in CO and PM10 nonattainment and maintenance areas.

#### Sec. 93.117 Criteria and procedures: Compliance with PM10 control measures.

The FHWA/FTA project must comply with PM10 control measures in the applicable implementation plan.

# Sec. 93.119 Criteria and procedures: Interim emissions in areas without motor vehicle budgets

The FHWA/FTA project must satisfy the interim emissions test(s).

**NOTE:** See EPA's May 6, 2005 conformity regulations for the full text associated with each section's requirements.

## PROPOSED PM2.5 STANDARD SUPPLEMENT TO THE YEAR 2005 CLRP AND FY 2006-2011 TIP AIR QUALITY CONFORMITY SCHEDULE

June 3, 2005	TPB Technical Committee Reviews Draft Work Scope for the Air Quality Analysis	
*June 15, 2005	TPB Releases Draft Work Scope for Public Comment and Inter- Agency Review	
*July 20, 2005	TPB Reviews Public Comments, Approves Draft Scope of Work	
September 9, 2005	TPB Technical Committee Reviews Draft Conformity Report	
September 15, 2005	Draft Conformity Report Released for Public Comment and Interagency Review	
*September 21, 2005	TPB Receives Briefing on Draft Air Quality Conformity Determination	
*October 19, 2005	TPB Reviews Public Comments on Draft Document, Approves Responses to Comments, and Adopts the PM 2.5Air Quality Conformity Determination	

\*TPB Meeting

#### WORK SCOPE ATTACHMENT A

#### POLICY AND TECHNICAL INPUT ASSUMPTIONS PM2.5 STANDARDS CONFORMITY ASSESSMENT

#### 1. Land Activity

- Round 7 Cooperative Forecasts
- 2. Policy and Project Inputs
  - Highway, HOV and transit projects and operating parameters
  - Financially constrained project submissions advanced by the TPB on 4/20/2005
- 3. Travel Demand Modeling Methods
  - 'Version 2.1 D #50' Travel Model
  - All HOV facilities at HOV-3 in 2010
  - Transit "capacity constraint" procedures (2010 constrains later years)
- 4. Emission Factors
  - Emission factors methods as developed and applied in the SIP and in the 2004 CLRP conformity process: MOBILE6.2, 2002 registration data, VMT mix specific to each analysis year
  - Enhanced I/M in DC, MD, and VA, using state-specified standards
  - Refinements based upon EPA's Mobile6.2 guidance
  - PM2.5 factors for total directly emitted particles and NOx precursors
- 5. Emissions Modeling Methods / Credits
  - Updated post-processor methods to reflect EPA guidance associated with Mobile6.2 model release updates for local road speed profiles in rural areas
  - Yearly PM2.5 emissions (total PM2.5 and NOx precursors) using latest seasonal traffic adjustments
  - Offline emissions analyses
- 6. Conformity Assessment Criteria
  - 5/6/05 EPA's "Transportation Conformity Rule Amendments for the New PM2.5 National Ambient Air Quality Standard: PM2.5 Precursors"
  - Analysis years: 2010, 2020, 2030

# Metropolitan Washington Air Quality Committee

Suite 300, 777 North Capitol Street, N.E. Washington , D.C. 20002-4239 202-962-3358 Fax: 202-962-3203

July 13, 2005

Honorable Phil Mendelson, Chair National Capital Region Transportation Planning Board 777 North Capitol Street, NE Washington, D.C. 20002

Dear Chair Mendelson:

Thank you for soliciting input on the scope of work for the Fine Particles (PM2.5) Standards Supplemental Air Quality Conformity Assessment of the 2005 CLRP and the FY2006-2011 TIP. According to EPA guidance, the Washington region is required to conduct a conformity determination for direct emissions and precursors of fine particulate pollution (PM<sub>2.5</sub>) by April 6, 2006 to avoid a conformity lapse. As proposed in TPB's scope of work, the TPB intends to complete the PM<sub>2.5</sub> conformity determination as a supplement to the on-going work to assess conformity for the 8-hour ozone standard in October 2005.

EPA's Transportation Conformity Rule Amendments provide two options for conformity determination during the interim period prior to the SIPs development in the new  $PM_{2.5}$  non-attainment areas and the establishment of mobile budgets for  $PM_{2.5}$  pollution and its precursors. The two options are (1) build no greater than no-build, or (2) build no greater than 2002. The TPB proposes to use Option 2, the build no greater than 2002 budget test in this year's conformity analysis. We note that both options provide an interim test until the state air agencies develop mobile emissions budgets for  $PM_{2.5}$  and its precursor pollutants. For this year's analysis, we support the TPB's choice of interim method because it makes the best use of available resources and supports the budget concept. For any  $PM_{2.5}$  conformity analysis in the coming years of the interim period, MWAQC urges TPB and the state air agencies to work together to determine which option is most appropriate for conformity analysis.

For the current  $PM_{2.5}$  conformity cycle, we support the TPB proposed approach of emissions analysis and conformity determination only for direct  $PM_{2.5}$  and for precursor NOx. We are urging the TPB and the three state air agencies to work together to determine which of the other precursors of  $PM_{2.5}$ (VOCs, SOx, ammonia etc.) contribute significantly for possible inclusion in the analysis for the next conformity cycle and beyond.

EPA is expected to release additional guidance on  $PM_{2.5}$  conformity. The proposed scope of work may change when this new additional guidance becomes available later this year. The MWAQC Technical Advisory Committee is available to work with TPB staff for making any needed changes in the work scope and to develop any other new inputs required to complete the analysis.

Meeting the  $PM_{2.5}$  standard is expected to require continuation of all mobile and non-mobile emission reduction commitments, and possibly new ones in the near future. States and local governments are urged to maintain their commitments to TERMs and other emission reduction measures, regardless of whether implementation of these measures is currently critical for conformity determination during the interim period.

Thank you for the opportunity to comment on the  $PM_{2.5}$  conformity assessment scope of work. We look forward to working closely with you on making further improvements to the region's air quality to meet the new PM2.5 standard.

Sincerely,

Dona Kaffman

Hon. T. Dana Kauffman, Chair Metropolitan Washington Air Quality Committee

#### **MEMORANDUM**

TO: Files

FROM: Ronald Milone

**DATE:** November 10, 2005

**SUBJECT:** Mobile Emissions PM 2.5 Post Processor Description and Results

#### 1.0 Introduction

This memorandum accompanies earlier documentation of the TPB mobile emissions post processor<sup>1</sup> and describes a newly developed process for estimating the amount of fine particulates (PM2.5) generated by mobile sources. The PM2.5 emissions post processor involves a series of TP+ scripts that are quite similar, and in some cases, identical to the existing process used to calculating mobile emissions in the TPB's annual Conformity Determination work. Like the existing post processor, the PM2.5 post processor combines EPA Mobile6-based emission rates with network link volumes and trip tables generated by the regional travel model. However, the PM2.5 post processor is different in the pollutants considered, the development of the emission rates, and the treatment of seasonal VMT adjustments.

The existing post processor addresses VOC, CO, and NOx pollutants. The Mobile6 based emission rates associated with these pollutants are developed on the basis of average seasonal conditions. VOC and NOx rates are reflective of a 'worst-case' condition during the ozone (summertime) season while CO rates are associated with a 'worst-case' wintertime condition. Since the network VMT generated by the travel model reflects average annual weekday traffic (AAWDT), network link volumes are factored to reflect weekday conditions for the time of year that is appropriate for the emissions calculation. The post processor is designed to calculate emissions using average *seasonal* weekday travel (ASWDT). With that said, the following distinguishing features of the PM2.5 post processor can be made.

- 1) Mobile6-based emission rates supporting the PM2.5 post processor relate to PM2.5 and NOx emissions only. NOx emissions are considered in the overall PM2.5 calculation since they indirectly contribute to particulate levels in the atmosphere. The PM2.5 rates currently generated by the Mobile model are VMT-based while NOx emissions are associated with trip-starts as well as miles traveled.
- 2) The PM2.5 post processor ultimately produces an *annualized* estimate of PM2.5 and NOx emissions for the Washington, D.C. MSA. The annual tonnage is estimated by first computing the *average daily* emissions on a seasonal basis. The daily emission result is then multiplied by the number of days of each respective season. Calculating emissions on a seasonal basis therefore requires the provision of seasonal PM2.5/NOx emission

<sup>&</sup>lt;sup>1</sup> See 9/16/05 Memorandum from Milone to Files on the subject: Mobile Emissions Post Processor Description and Results.

rates from Mobile6, and network link VMT that reflects average seasonal travel for each season of the year. Table 1 lists VMT factors that are used to convert AAWDT volume to average daily seasonal traffic (ASDT). The number of days in each season is also displayed.

Season	Months	AAWDT to ASDT Factor	No. of Days
Winter	December – February	0.9028	90
Spring	March – May	0.9570	92
Summer	June-August	0.9984	92
Fall	September-November	0.9445	91

 Table 1: Seasonal Parameters Used in the PM2.5 Emission Calculation

3) The PM2.5 reporting is based on a modified definition of the Washington MSA area with respect to earlier reporting. The PM2.5 MSA report is based on a ten-jurisdiction area comprised of the District of Columbia, Montgomery County, Prince George's County, Arlington County, the City of Alexandria, Fairfax County, Loudoun County, Prince William County, Frederick County, and Charles County. Previous MSA reports included the above jurisdictions with Stafford and Calvert Counties added.

#### 2.0 Mobile6 Emission Rate Processing

PM2.5 and NOx emission rates used in the PM2.5 post processor are prepared on a county-specific basis, as shown Table 2. The table indicates that emission rates are explicitly modeled (using Mobile6) for 16 of the 27 jurisdictions. The remaining 11 jurisdictions are assigned 'borrowed' rates from neighboring modeled jurisdictions.

The Mobile6 model generates PM2.5 and NOx rates by jurisdiction in separate batch executions. PM2.5 Mobile6 listing files are produced for each of the 16 modeled jurisdictions. Each listing contains emission rate summaries for 8 scenarios: stabilized network rates by season (Winter, Spring, Summer, and Fall), and stabilized local road rates by season. The PM2.5 emission rates generated by Mobile6 do not vary by speed, in contrast to NOx rates which are sensitive to highway speed. The emission rate listings are processed by a Fortran program (M6RATESPM.EXE) so that PM rates are consolidated onto a machine readable text file. A single file is created for each jurisdiction and is assigned a special name that is referenced by the batch file (Seasonal\_Emiss.bat) that executes the post processor.

Since NOx emission rates vary by operating mode and by speed, the number of Mobile6 seasonal emission scenarios is considerably larger than the PM2.5 scenarios. Table 3 indicates that 716 Mobile6 scenarios are executed, resulting in a lengthy listing file for each modeled jurisdiction. Another program named M6RATESS.EXE is used to convert each listing into six machine readable files containing seasonal NOx rates for stabilized network arterials, stabilized network freeway non-ramps, stabilized freeway ramps, local hot and cold starting rates, local stabilized rates, and stabilized/local arterial rates. All files contain per-mile rates by speed (if relevant) that are arrayed by season (Winter, Spring, Summer, and Fall). The cold/hot starting rates, however, are converted into per-trip rates. The six files are assigned special names that are referenced by

the batch file that executes the post processor. The reader should consult the above referenced 9/16/05 memorandum for computation details of the M6RATESS program (which are identical to those of the documented M6RATES program).

Emission Area System Number	Jurisdiction / External Area	File- name code	MSA Member Yes/No	Mobile Rates Modeled/Borrowed

133	Hot	Local	Single speed / 12.9 mph
134	Stabilized	Local	Single speed / 12.9 mph
135-179	Stabilized	Arterial(w/ Rural VMT Mix)	1 to 45 mph in 1 mph increments
<b>Spring:</b> 180-244	Stabilized	Arterial	1 to 65 mph in 1 mph increments
245-309	Stabilized	Freeway, Non-Ramp	1 to 65 mph in 1 mph increments
310	Stabilized	Freeway Ramp	Single speed / 35.0 mph
311	Cold	Local	Single speed / 12.9 mph
312	Hot	Local	Single speed / 12.9 mph
313	Stabilized	Local	Single speed / 12.9 mph
314-358	Stabilized	Arterial(w/ Rural VMT Mix)	1 to 45 mph in 1 mph increments
Summer: 359-423	Stabilized	Arterial	1 to 65 mph in 1 mph increments
424-488	Stabilized	Freeway, Non-Ramp	1 to 65 mph in 1 mph increments
489	Stabilized	Freeway Ramp	Single speed / 35.0 mph
490	Cold	Local	Single speed / 12.9 mph
491	Hot	Local	Single speed / 12.9 mph
492	Stabilized	Local	Single speed / 12.9 mph
493-537	Stabilized	Arterial(w/ Rural VMT Mix)	1 to 45 mph in 1 mph increments
<b>Fall :</b> 538-602	Stabilized	Arterial	1 to 65 mph in 1 mph increments
603-667	Stabilized	Freeway, Non-Ramp	1 to 65 mph in 1 mph increments
668	Stabilized	Freeway Ramp	Single speed / 35.0 mph
669	Cold	Local	Single speed / 12.9 mph
670	Hot	Local	Single speed / 12.9 mph
671	Stabilized	Local	Single speed / 12.9 mph
672-716	Stabilized	Arterial(w/ Rural VMT Mix)	1 to 45 mph in 1 mph increments

Table 3: Sequence of NOx Emission Mobile Scenarios Generated for each Jurisdiction

Thus, the PM2.5 post processor requires 112 emission rate files containing seasonal emission rates: 16 PM2.5 emission rate files (one for each modeled jurisdiction) and 96 NOx emission rate files (6 rate files for each of the 16 jurisdictions). Table 4 describes the files that are developed for each jurisdiction as inputs to the PM2.5 post processor.

Filename	File Description	Notes
M6 <yr>PM<jr>.N_L</jr></yr>	Stabilized/PM Netwok/Local rates	A one-line text file containing nine items: a speed value and 8 PM2.5 rate values(gm./mi): network rates by season (Win.,,Spr.,,Sum.,Fall) and local rates by season (Win.,,Spr.,,Sum.,Fall)
M6 <yr>Nx<jr>.R_A</jr></yr>	Stabilized/Arterial Running NOx rates	A 65-line text file containing five items: speed, NOx rates (all gm/mi) by season (Win.,,Spr.,,Sum.,Fall).
M6 <yr>Nx<jr>.R_F</jr></yr>	Stabilized/Freeway non-ramp Running NOx rates	A 65-line text file containing five items: speed, NOx rates (all gm/mi) by season (Win.,,Spr.,,Sum.,Fall).
M6 <yr>Nx<jr>.RAM</jr></yr>	Stabilized/Freeway ramp Running NOx rates	A one-line text file containing five items: speed, NOx rates (all gm/mi) by season (Win.,,Spr.,,Sum.,Fall).
M6 <yr>Nx<jr>.STT</jr></yr>	Cold/Hot start rates	A one-line text file containing five items: speed, NOx Cold start rates rates (all gm/trip) by season (Win.,,Spr.,,Sum.,Fall), and Hot start rates by season (Win.,,Spr.,,Sum.,Fall).
M6 <yr>Nx<jr>.LCL</jr></yr>	Stabilized/Local Running NOx rates	A one-line text file containing five items: speed, NOx rates (all gm/mi) by season (Win.,,Spr.,,Sum.,Fall).
M6 <yr>Nx<jr>.R_R</jr></yr>	Stabilized/Arterial Running/Rural NOx rates	A 45-line text file containing five items: speed, NOx rates (all gm/mi) by season (Win.,,Spr.,,Sum.,Fall).

 Table 4: Emission Rates PM2.5 Post Processor Input File Descriptions

Note: <Yr> relates to year, e.g., '02', '10', '30' etc./ <Jr> relates to a two-digit juris code(see Table 2)

#### 5.0 PM2.5 Post-Processor Program Steps

The PM2.5 post processor may be executed with the provision of: 1) travel demand output files, 2) emission rate files by jurisdiction as described above, and 3) a small text file containing jurisdiction level VMT information. The travel demand output files include the final iteration loaded highway network (I6HWY.NET) and three vehicle trip tables corresponding to the AM, PM, and off peak periods (I6AM.VTT, I6PM.VTT, I6OP.VTT). The jurisdictional VMT file (Base\_Juris\_VMT.txt) is a pre-existing file containing base year estimates of network-based VMT, local (or off-network) VMT, and the estimated proportion of network VMT that is urban and rural. This information is used to develop future year local VMT that is urban and local. All VMT information corresponds only to jurisdictions within the MSA as defined above.

The TP+ scripts used to execute the PM2.5 post-processor are described below in order of execution. The computations are identical to those documented in the above referenced 9/16/05 memorandum, except that:

- VOC and CO emissions generation has been removed
- PM emissions generation has been added

- The batch file executing the post processor has been modified so that it executes four times, for each modeled season

- The summary routines have been modified so that *seasonal* emission totals are listed out at jurisdiction level and at the MSA level, in addition to *daily* emission totals.

The five steps are summarized below. (Associated TP+ script names are in parenthesis):

1) Trip Table Formatting (AQTRIPS.S): AM, PM, and off-peak trip tables produced by the travel demand model are read. The program produces zonal trip-ends for each of the three time periods. It also produces a file containing the proportion of daily vehicle trips from/to each of the 27 emission areas. Since the trip proportions are developed with daily trips, the proportion in the i/j direction is generally the same as that in the j/i direction.

2) Time-of-Day Trip-Ends Program (ZONESPRD.S): The program reads the zonal origins and destinations, described above, and apportions them among discrete hourly periods.

3) VMT Formating Program (Pre\_Local.S): The program summarizes modeled VMT at the jurisdiction level and writes a summary file to be used in the LOCAL.S program.

4) Time-of-Day VMT and speeds program (PEAK\_SPREAD\_Seasonal\_Nx.S): The program reads the AM, PM, and off-peak network link volumes produced by the travel demand model. It produces hourly volumes, VMT, and restrained speed for each highway link. The hourly VMT and highway speeds are sensitive to seasonal adjustment factors.

5) Running Emissions Program (RUNNING\_Seasonal\_Nx.S): The program computes hot stabilized emissions on a link-by-link and hour-by-hour basis. It reads 1) the hourly link VMT and highway speed files developed above, 2) MOBILE6-based running emission rates which are provided on the basis of speed, and 3) the county level trip proportions file. PM2.5 and NOx running emissions result from the program.

6) Start/Soak Emissions Program (STRT\_SKR\_Seasonal\_Nx.S): The program applies emission rates to the trip- ends to compute start-up and soaking emissions on a zone-by-zone and hour-by-hour basis. The program reads: 1) hourly trip-ends, 2) the MOBILE6-generated cold/hot starting rates, and 3) the county-level trip proportions file. NOx starting emissions result from the program. Note that trip tables are not affected by seasonal adjustments.

7) Local Emissions Program (LOCAL\_Seasonal\_Nx.S): The program computes hot stabilized emissions on a link-by-link and hour-by-hour basis. It reads 1) a file containing forecasted local/urban and local/rural VMT at the jurisdiction level and 2) PM2.5 and Arterial NOx stabilized rates specially developed for local roads. PM2.5 and NOx rates are produced.

A batch file (Seasonal\_Emiss.Bat) is normally used to facilitate the execution the above scripts in a 'command prompt' window. The batch file defines the input file locations, defines global environment variables that are referenced by the scripts (the modeled year, the seasonal VMT adjustment, the number of days in each season, and text labels), and then executes the scripts. After executing steps 1-3, steps 4-7 are excecuted four times, i.e., for each of the four seasons. The batch file ultimately produces three small text files containing jurisdiction level running, starting, and local emissions at the jurisdiction and MSA levels, by season (Winter, Spring, Summer, and Fall). The files are named:

- <year>\_running.txt
- <year>\_strt\_skr.txt
- <year>\_local.txt

#### MEMORANDUM

November 15, 2005

- To: Air Quality Conformity File
- From: Daivamani Sivasailam
- Subject: Transit Bus Emissions for PM 2.5 Conformity Assessment of the 2005 CLRP and FY 2006 FY 2011 TIP

This memo discusses the development of direct fine particles (PM 2.5), and NOx precursors emissions estimates for transit buses for the conformity analysis years.

#### Approach

This effort pivots from previously collected transit data (survey and emissions estimation are described in the 8-hour Ozone and Winter CO conformity assessment report), where the data were analyzed on a daily basis, annual statistics were also available from that effort and were applied in the PM 2.5 assessment.

The annual VMT from the survey was divided by the number of service days for each provider to calculate a daily VMT for the 2002 base year. Using the appropriate emissions factor, based on the average operating speed for each provider and the season, staff calculated the daily direct PM 2.5 and NOx precursor emissions for transit buses for each season. From the daily estimates, seasonal total, based on the number of days per season and the annual total emissions were estimated. The following table shows year 2002 estimation of transit bus emissions. Similar methods were used to estimate emissions for 2010, 2020 and 2030 analysis years.

Notes:

1) Used WMATA percent VMT by jurisdiction from FY03-08 AQC, Appendix I (page I-3)

2) Assumed average freeway speed of 55 mph where higher than 55 speed limit is available,

and 45 mph where speed limit is 55

November 15, 2005

#### Memorandum

To:	Air Quality Conformity Files
From:	Daivamani Sivasailam Principal Transportation Engineer

Subject: PM 2.5 Emissions Inventory of School Buses

This memorandum outlines the procedure that staff followed to develop the fine particulate matter (PM 2.5) emissions inventory from the school bus fleet in the region as part of the conformity analysis of the 2005 Constrained Long Range Plan (CLRP) and FY 2006- FY 2011 Transportation Improvement Program (TIP).

In calendar 2001, staff compiled annual vehicle miles of travel (VMT) from the school systems in the region; this annual VMT was used to develop the 2002 base year emissions inventory. As the first step, the daily VMT by school system was estimated by dividing the annual VMT by number of days the different school systems operate, which varies from 190 days to 220 days. The average operating speed of the buses was also obtained from the 2001 survey; and speeds vary from a low of 14 mph to a high of 30 mph. Using the emissions rates for the appropriate speed and season, and the daily VMT, staff estimated direct PM 2.5 and NOx precursor emissions for each of the school systems. Using the daily emissions and the number of days the school buses operate each season, the emissions for the four seasons were estimated. As a final step the annual emissions for the four seasons.

Similarly, emissions inventories for 2010, 2020, and 2030 were estimated assuming a 0.5% growth rate per year applied to the VMT reported in the base year. The following two pages show the tables depicting the daily and seasonal emissions inventories for 2002 base year.

## Memorandum

To: Air Quality Files

From: Eulalie G. Lucas Transportation Engineer

Date: 11/16/2005

**Re:** Auto Access to Transit Emissions Calculations: PM2.5 and NOx Precursor

#### Introduction:

The Environmental Protection Agency (EPA) in 2004 designated the District of Columbia, four counties in Maryland and five in northern Virginia as the Washington Metropolitan non-attainment area due to violation of health standards for fine particles PM2.5. Non-attainment areas were given one year from April 2005 to demonstrate conformity or face a lapse. In response to this federal requirement COG/TPB staff calculated PM2.5 direct and NOx precursor emission estimates associated with travel from the region's 2005 Constrained Long Range Plan (CLRP) and the FY2006-2011 Transportation Improvement Plan (TIP). Procedures used for these calculations required changes to the approach used in ozone season emission estimates since these emissions are reported on an annual not daily basis. The following paragraphs describe these procedures and updates and serve as documentation for PM2.5 and NOx emissions associated with travel to transit and park and ride lots in the PM2.5 non-attainment area.

#### Vehicle Mix and travel data:

VMT Mix percent associated with auto access to transit includes only passenger cars and light duty trucks, (not heavy duty trucks as with network VMT mix percents), used by commuters to access transit and park and ride lots. Because travel estimates to transit and 'park and ride' lots reflect commuting traffic only, the conversion from daily to annual reporting included only five days per week unlike network travel where staff assumed seven days.

#### Methodology:

The procedure used in the calculation of emissions associated with auto access to transit is an offline process like transit and school bus emissions calculations. The approach is very simple: it involves the application of an emissions rate to each of the various components of travel, i.e., start up, running (35 mph for arterials and 45 mph for freeways) and hot soak. For trips originating outside the MSA, only those miles within the MSA are used in the calculation. Forecasting for 'out years' is based on growth trends for total internal modeled transit trips applied to the MWCOG/DTP 2002 Park and Ride Utilization inventory data.

Separate emissions rates are applied by components of a trip cycle, i.e., a start up rate for trip origins, a running rate for the running component, and a hot soak rate for trip destinations. These three rates represent an average of the ten composite rates for jurisdictions in the non-attainment area and for all light duty vehicle types (HDD fractions were zeroed out of the VMT Mix). This

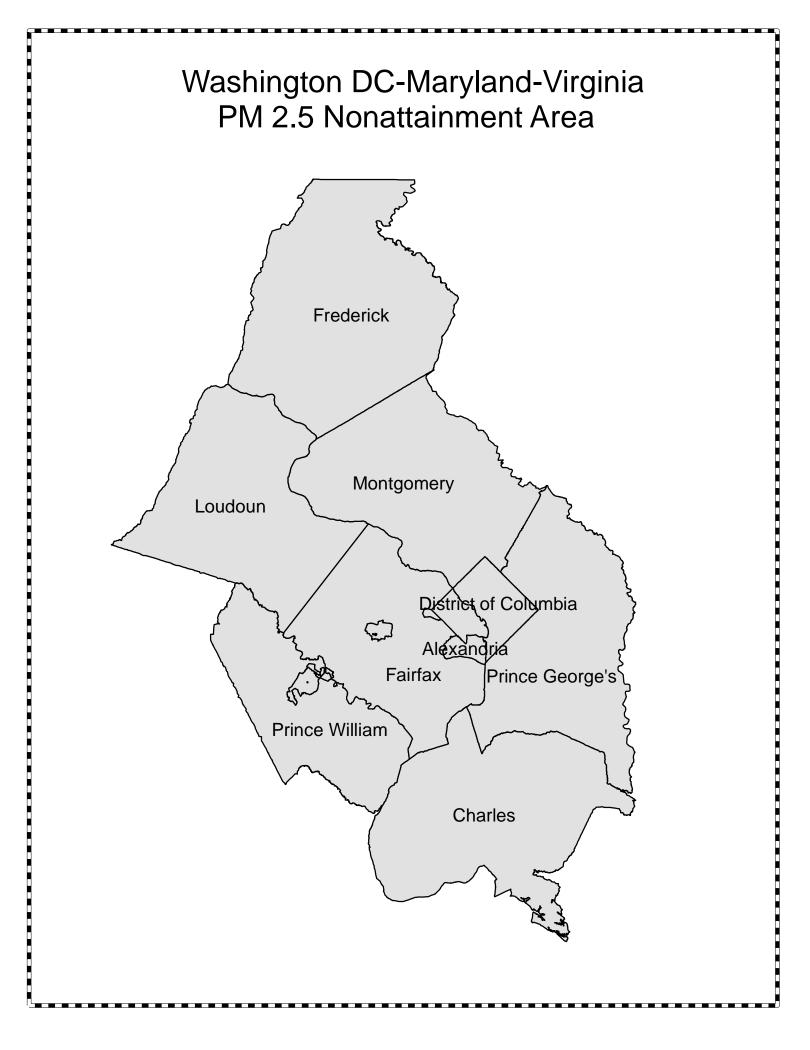

adjustment was made based on the assumption that heavy duty vehicles such as tractor trailers are not used by commuters for trips to and from transit locations or to park and ride lots.

#### **Updates:**

The travel demand data used for the PM2.5 analysis are consistent with the 2005 CLRP ozone season analysis: travel demand model runs used Version 2.1D #50; the land activity forecasts are from Co-operative Forecasts Round 7; and the Mobile emissions were generated from Mobile model version 6.2. The seasonal adjustments in the table below were applied (see Mike Clifford and Daivamani Sivasailmani's memo dated May 5<sup>th</sup>, 2005) to convert AAWDT travel demand to AWDT for each season of the year; travel days and emissions were then developed for each season according to the number of commuting days in each season of the year. The table below lists these percents; also included is a map of the non-attainment area.

Results for 2002 for the winter season are shown in Exhibits 1 and 2; the other analysis years 2002, 2020 and 2030 are available in the full technical report.

Season	Adjustment Factor	Number of Commuting Days
	AAWDT to AWDT season	Per Season
Winter	.97	65
Spring	1.02	66
Summer	1.05	66
Fall	1.00	65
