Agency

The Metropolitan Washington Council of Governments (COG) and the National Capital Region Transportation Planning Board (TPB).

COG serves as the regional planning organization for the Washington metropolitan area. COG works toward solutions to regional problems, especially those related to regional growth, transportation, housing, human services, and the environment. The TPB is the designated Metropolitan Planning Organization (MPO) for transportation for the Washington region. Members of the TPB include representatives of local governments; state transportation agencies; the Maryland and Virginia General Assemblies; the Washington Metropolitan Area Transit Authority; and non-voting members from the Metropolitan Washington Airports Authority and federal agencies.

Abstract

This report describes the development of highway and transit networks that represent the ground transportation system of the Washington, D.C. metropolitan area for the purposes of travel demand modeling. The networks meet the time-of-day requirements of COG's Version 2.1/TP+ travel demand models employed in the Constrained Long Range Plan and Transportation Improvement Program Air Quality Conformity process. COG's Geographic Information System (GIS) has been employed to pre-process and manage network components, and is used to link the transportation network development process and TPB planning activities, including Cooperative Forecasting, Corridor Studies, Models Development, Congestion Monitoring, and the Regional Transportation Data Clearinghouse. The networks developed this fiscal year are consistent with specifications documented in COG report entitled, "COG/TPB Travel Forecasting Model Version 2. 1 D #50 User's Guide", November 17, 2004. This work program represents a continuation of a multi-year networks and models development plan that was formulated in FY-93 under the direction of the Travel Forecasting Subcommittee, a subcommittee of the Transportation Planning Board's Technical Committee.

1 Introduction

This report documents work activities completed by COG/TPB staff in accordance with the transportation network development element identified in the *FY-2004 Unified Planning Work Program* (UPWP). Network development activities are designed to support the regional forecasting procedure known as the “Version 2.1 D #50” travel model. The model is an advanced four-step tool developed by COG’s models development staff.^{1 2} It includes work and non-work mode choice models as well as time-of-day-specific traffic assignments: AM peak period, PM peak period, and the off-peak period. The networks developed this fiscal year are consistent with specifications documented in COG report entitled, “COG/TPB Travel Forecasting Model Version 2.1 D #50 User’s Guide”, November 17, 2004.

The focus of network development activity during FY-2004 was support of the air quality conformity analysis of the FY2005-2010 Transportation Improvement Plan (TIP) and the region’s 25-year Constrained Long Range Transportation Plan (CLRP), as amended in 2004. This activity began with the compilation of the latest available transit route and schedule information in peak and off-peak formats required for the Version 2.1 D #50 model. Using transit data obtained electronically and/or in paper formats, information in COG’s GIS and Data Clearinghouse, and traffic count data, transportation networks were developed depicting current year conditions. Using these networks as a starting point, highway and transit networks and supporting data files were developed for use in the analysis of the FY2005-2010 TIP and 2004 CLRP.

Network coding for each conformity cycle normally occurs in March, in preparation for model executions commencing in May. During FY2004, the conformity cycle began in late May. Due to the extensive debate by the TPB on the inclusion of the Inter County Connector element in the CLRP and TIP update, and the decision to code both the Master Plan and Northern Alignments in the forecast networks for 2015, 2025, and 2030, work was not completed until early FY2005. Network files were prepared for the years 2005, 2015, 2025, and 2030, for use with the Version 2.1 D #50 model.

The sections below describe general network development concerns, including an overview of the network development program, COG’s transportation analysis zone (TAZ) system, and the network node numbering system. A review of the changes assumed in the FY2005-2010 TIP and 2004 CLRP is presented in Chapter 2. A detailed description of the network elements produced by the network development team is detailed in Chapter 3.

The network development process continues to be facilitated by improvements in communications technology and emerging software tools. Information transfer between agencies is increasingly being conducted in electronic form. There has been an increased reliance on using the Internet to obtain updated information in a timely manner. Staff has also been relying upon GIS-based databases at COG to develop network files in a more accurate and consistent manner.

¹ COG/TPB Travel Forecasting Model, Version 2.1 D #50, *Calibration Report*, November 17, 2004.

² COG/TPB Travel Forecasting Model, Version 2.1 D #50, *User’s Guide*, November 17, 2004.

1.1 Transportation Network Files

Transportation forecasting models are used to estimate vehicle and transit-person volumes through a process of finding equilibrium between demand and supply. Networks are used in the modeling process as abstractions of the regional highway and transit system. As such, they can be viewed as the ‘supply-side’ of the transportation model.

Highway networks are generally developed to conform to a pre-defined TAZ system. Therefore, network coding is finer for developed areas containing physically small zones and coarser for less-developed areas containing larger zones. The current study area for Washington, D.C., referred to as the “expanded cordon” region, is shown as Exhibit 1-1.

The cordon encompasses a land area of 6,800 square miles and is comprised of 22 jurisdictions³, spanning the District of Columbia, Northern Virginia, suburban Maryland, and one county in West Virginia. A typical COG/TPB highway network consists of about 18,000 directional highway links.

Roads can be classified into four major types: freeways, arterials, collectors, and locals. COG/TPB highway networks typically include all freeways and arterials, most collectors, and some local roads.

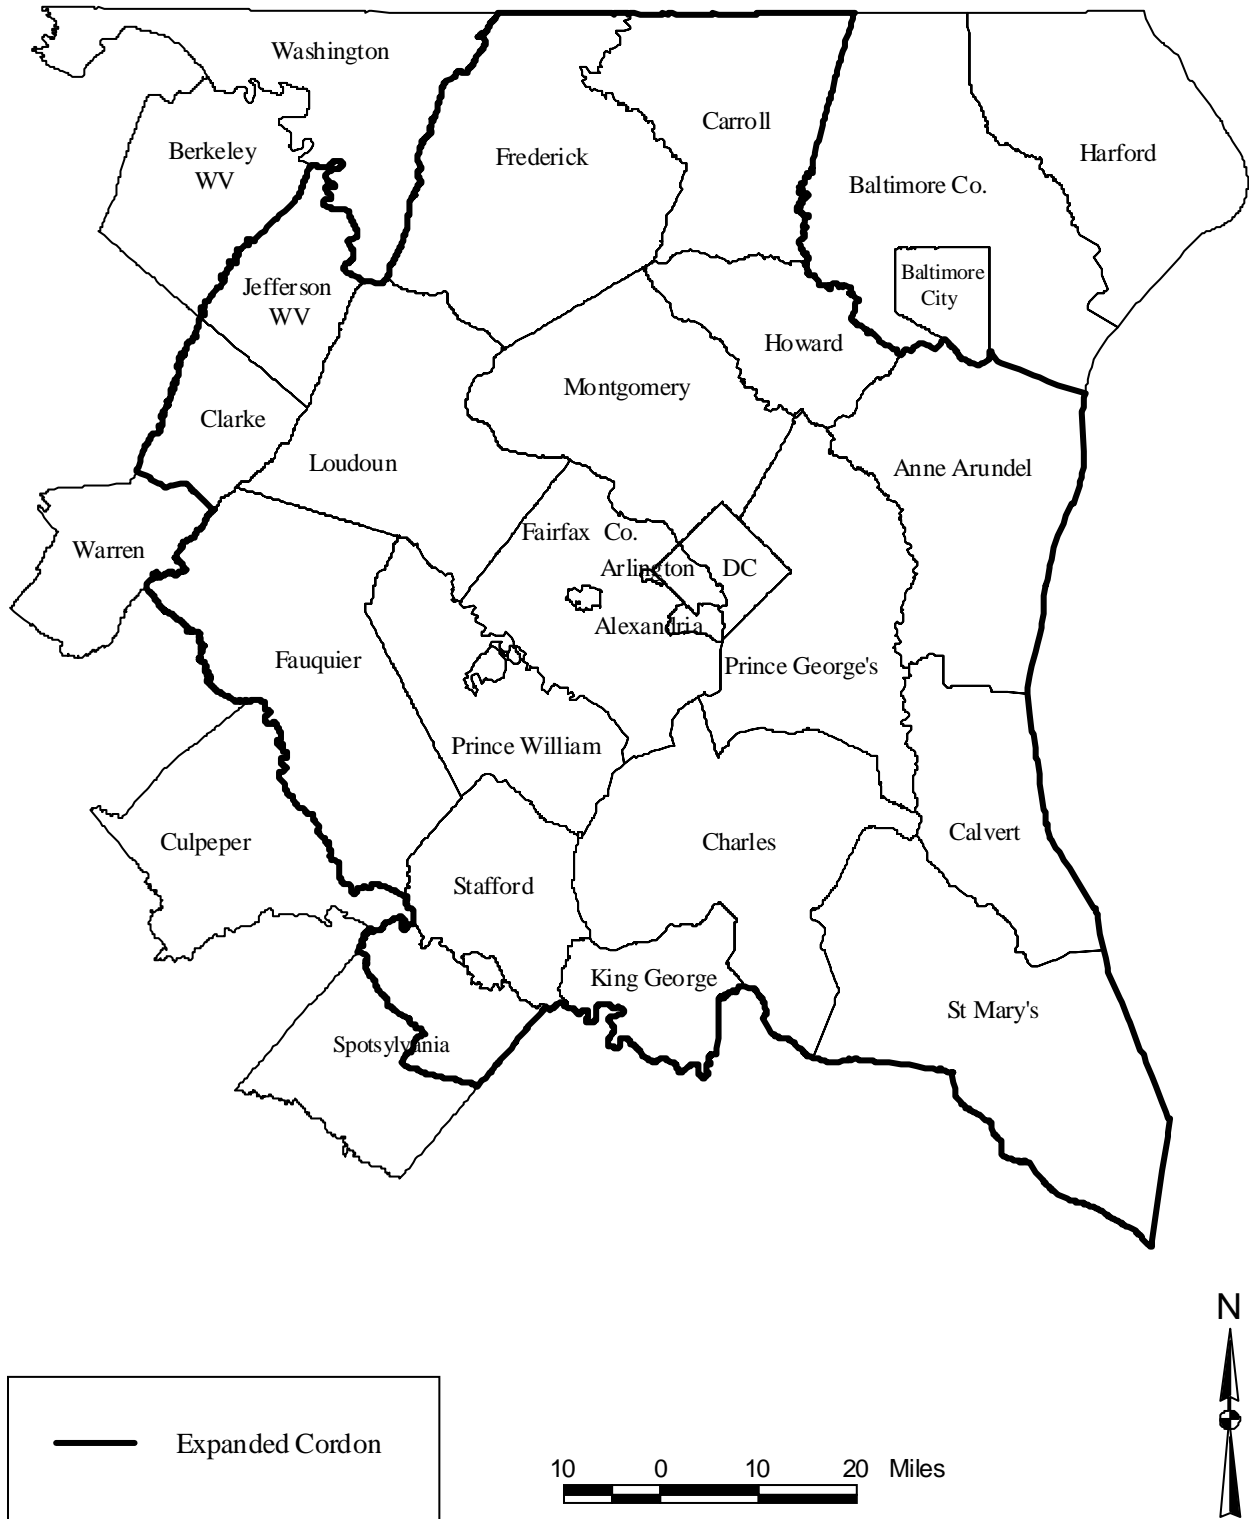

Beyond the design of the zone system, transportation networks are developed reflecting two basic considerations: the requirements of the transportation model, and the requirements and/or constraints of the software used to apply the model. Networks are used to estimate service levels (e.g., travel times and costs) between TAZ, which figure into the distribution of travel and the choice of mode. They are also necessary for determining the choice of route for the modeled modes and the development of travel volumes. The Version 2.1 D #50 model requires AM and off-peak transit and highway networks at zonal level for trip distribution and mode choice. A PM highway network is also required in the Version 2.1/TP+ process to complete the traffic assignment process.

The files that result from the COG’s network development process for the purposes of modeling are highway link files, transit line files, transit network support files such as rail (non-highway links) links and transfer links. Because the transit fare estimation used by MWCOG models is derived from transit path-based information, transit fare development is implicitly considered as a component of the network building process. Therefore, files supporting the estimation of transit fares are also prepared in network development.

The files that support network building and the fare development processes of the Version 2.1 D #50 model are described in greater detail in Chapter 3.

³ The expanded cordon bisects one of the 22 jurisdictions, Spotsylvania County. Its northern portion (approximately north of VA 606) is within the modeled area and the remaining area is outside. The expanded cordon includes all other jurisdictions in their entirety.

Exhibit 1-1: 2,191-Zone COG/TPB Modeled Area

1.2 Overview of Network Development

Given the importance and regularity of COG's annual air quality conformity studies in recent years, network development has evolved into a cycle of activities around this yearly event. During late summer and fall, transit and highway network summaries from the previous conformity study are compiled. The summaries are used as a point of comparison for the next round of files to be developed. A solicitation of transit data from the local providers is also made during the fall to ensure that the base-year transit files are verified (or refreshed) with the most recent data. During winter, the development of planned improvements for the next TIP cycle is formulated through the COG/TPB process. Network coding for the next conformity cycle normally occurs in March, in preparation for model executions commencing in May. During FY2004, network files for use in the air quality conformity analysis of the FY2005-2010 TIP and 2004 CLRP were prepared for the years 2005, 2015, 2025, and 2030 and for use with the Version 2.1 D #50 model.

Transportation network development is a lengthy process involving the compilation of data from a number of agencies in the region and updating of existing data sets to the appropriate years. The process also entails the application of ArcInfo, SAS, and Fortran programs to update, build, and generate highway network files, to summarize files, to check the integrity and accuracy of the files, and to check that the changes in attributes between years are reasonable. A number of intermediate development steps are not discussed in this report. Instead, the intention of this report is to provide information on the files that result at the end of the development process, which directly support travel modeling.

1.3 Overview of Version 2.1 D #50 Model Networks

The Version 2.1 D #50 model is a four-step travel model, applied on the 2,191-zone (expanded cordon) study area. Three highway networks are required representing weekday operations occurring in the AM peak period (6:00-9:00 AM), the PM peak period (4:00-7:00 PM), and the off-peak period (comprised of the remaining 18 hours). Highway network coding reflects operational differences between the three periods. Examples of operational differences may include directionality changes (alternating one-way/two way operations), lane configuration changes, or vehicle prohibition changes (for example, facilities that are dedicated for HOV facilities during peak periods, but revert to general use operations during non-peak times).

The Version 2.1D, #50 travel model requires zone-to-zone travel times and fares (known collectively as "skims") representing peak period conditions and off-peak conditions. The one-hour time period from 7:00 AM to 7:59 AM is used to represent peak period conditions and the five-hour time period from 10:00 AM to 2:59 PM is used to represent off-peak period conditions. Consequently, for each network scenario, transit networks corresponding to these two time periods are developed. The transit networks are built over the highway networks. Transit paths are categorized into two access markets: walk-access and drive access.

The Version 2.1 D #50 model also explicitly utilizes a transit accessibility measure, which is derived using transit network times, in the development of the vehicle availability model. The vehicle availability model, in turn, affects the computation of trip generation.

1.4 New Developments

The elements that distinguish the Version 2.1 D #50 model networks from prior travel model networks pertain to an assortment of parameter updates and procedural modifications. The updates that pertain to network development are summarized below:

- A toll modeling capability has been added to the model so that monetary values are considered in the trip distribution, mode choice, and traffic assignment steps (Previously tolls were considered only in mode choice). The capability involves converting monetary toll values to an equivalent time that is, in turn, added to the normal highway time, therefore affecting highway path building. The added toll capability is a first step towards making the model sensitive to highway pricing policies. Like the Version 2.1 C model, a TOLL variable is used in the #50 model to specify current year toll charges. However, the #50 model additionally requires a toll type variable (TOLLGRP) that varies from 1-9. The TOLLGRP attribute is referenced in other parameter files (TOLL.ESC and TOLL.SKM) to convert the link coded toll into equivalent minutes and to optionally modify the toll specification by time period and vehicle type.
- All cost components in the model previously developed in constant 1980 dollars are now developed in 1994 dollars. 1994 is the base year of the model calibration. These components include parking costs, highway tolls, and transit fares. All deflation factors in the model (i.e., in the highway building and transit fare building steps) are used to convert current-year costs into base-year 1994 costs.
- A new highway link variable is added to COG's Version 2.1 D #50 model highway networks. The variable "Proj_ID" is used to link highway projects in the TIP and CLRP to highway network links. This highway link-Proj_ID relationship is employed in COG's GIS-based highway development (GBHD) process that employs a listing of TIP and CLRP projects to update a base year highway network in ASCII format. The process generates networks for any year specified by the user.
- During FY2004 new procedures were used to model bus routes that access bus priority lanes. This process was first applied to model special bus treatments contained in the CLRP+ Scenario for the Regional Mobility and Accessibility Study. Two transit projects that were modeled in that study have been added to FY2005-2010 TIP and 2004 CLRP.

The transit projects are: 1) a "priority lane" restricted to buses on K Street between 9th Street N.W. and 22nd Street N.W. in the District of Columbia for 2010, and 2) A "priority lane" restricted to buses and right turning vehicles on US 1 between VA 235 North and I-95 Capital Beltway in Fairfax County for 2025. These preferential lane segments are assigned bus speeds of 22 mph.

The procedure for coding bus routes using priority bus lanes is applied using the TP+ Transit Processor module (TRNBUILD). Only transit line files in the TRNBUILD format are modified. A utility program "NETSW2" (Step03.PP Transit Prep.Bat: Transit preparation), that is used to convert transit line files from TRNPTH to TRNBUILD format, does not accept TRNBUILD keyword codes. The corresponding transit lines in TRNPTH line files are not modified and moved to the rear of the

FY-2004 Network Documentation: Highway and Transit Network Development

mode file. To set the bus speed for routes accessing a segment of priority bus lanes, the keyword SPEED is used to set the speed for all following links in the line (that are taken from the input network or any link records), until another SPEED or TIMEFAC keyword is encountered.

SPEED may only be specified within a node string. An example of the Line control statement containing familiar keywords NAME, ONEWAY, MODE, FREQ, and the newly applied SPEED keyword are displayed in below.

```
LINE NAME=S01#1I,ONEWAY=Y,MODE=01,FREQ[1]=6,  
  N= 9042 SPEED=13 N=9208 9210 9211 9214 9215,  
  9216 9218,

  8837 8603 8631 8655 8664
```

1.5 Expanded Cordon Area and Node Numbering Systems

The area system used for the expanded cordon is based on a 2,191 TAZ (transportation analysis zone) number system. The number system includes both internal TAZ and external stations. Because the system provides for “spare” zones that may be utilized for future studies, the number of actual ‘used’ internal TAZ currently in use is 1,972. The TAZ are numbered sequentially in ranges corresponding to the modeled jurisdictions.

An equivalence table indicating the relationship of TAZ ranges to jurisdictions is shown in Exhibit 1-2 (Note, the district area system shown in Exhibit 1-2 is not used in Version 2 models).

The exhibit indicates that the TAZ range allocation for each jurisdiction is inclusive of both “existing” and “spare” zones. The exhibit also indicates that the area system contains 47 external stations, numbered from 2145 to 2191. The locations of external stations are shown in Exhibit 1-3.

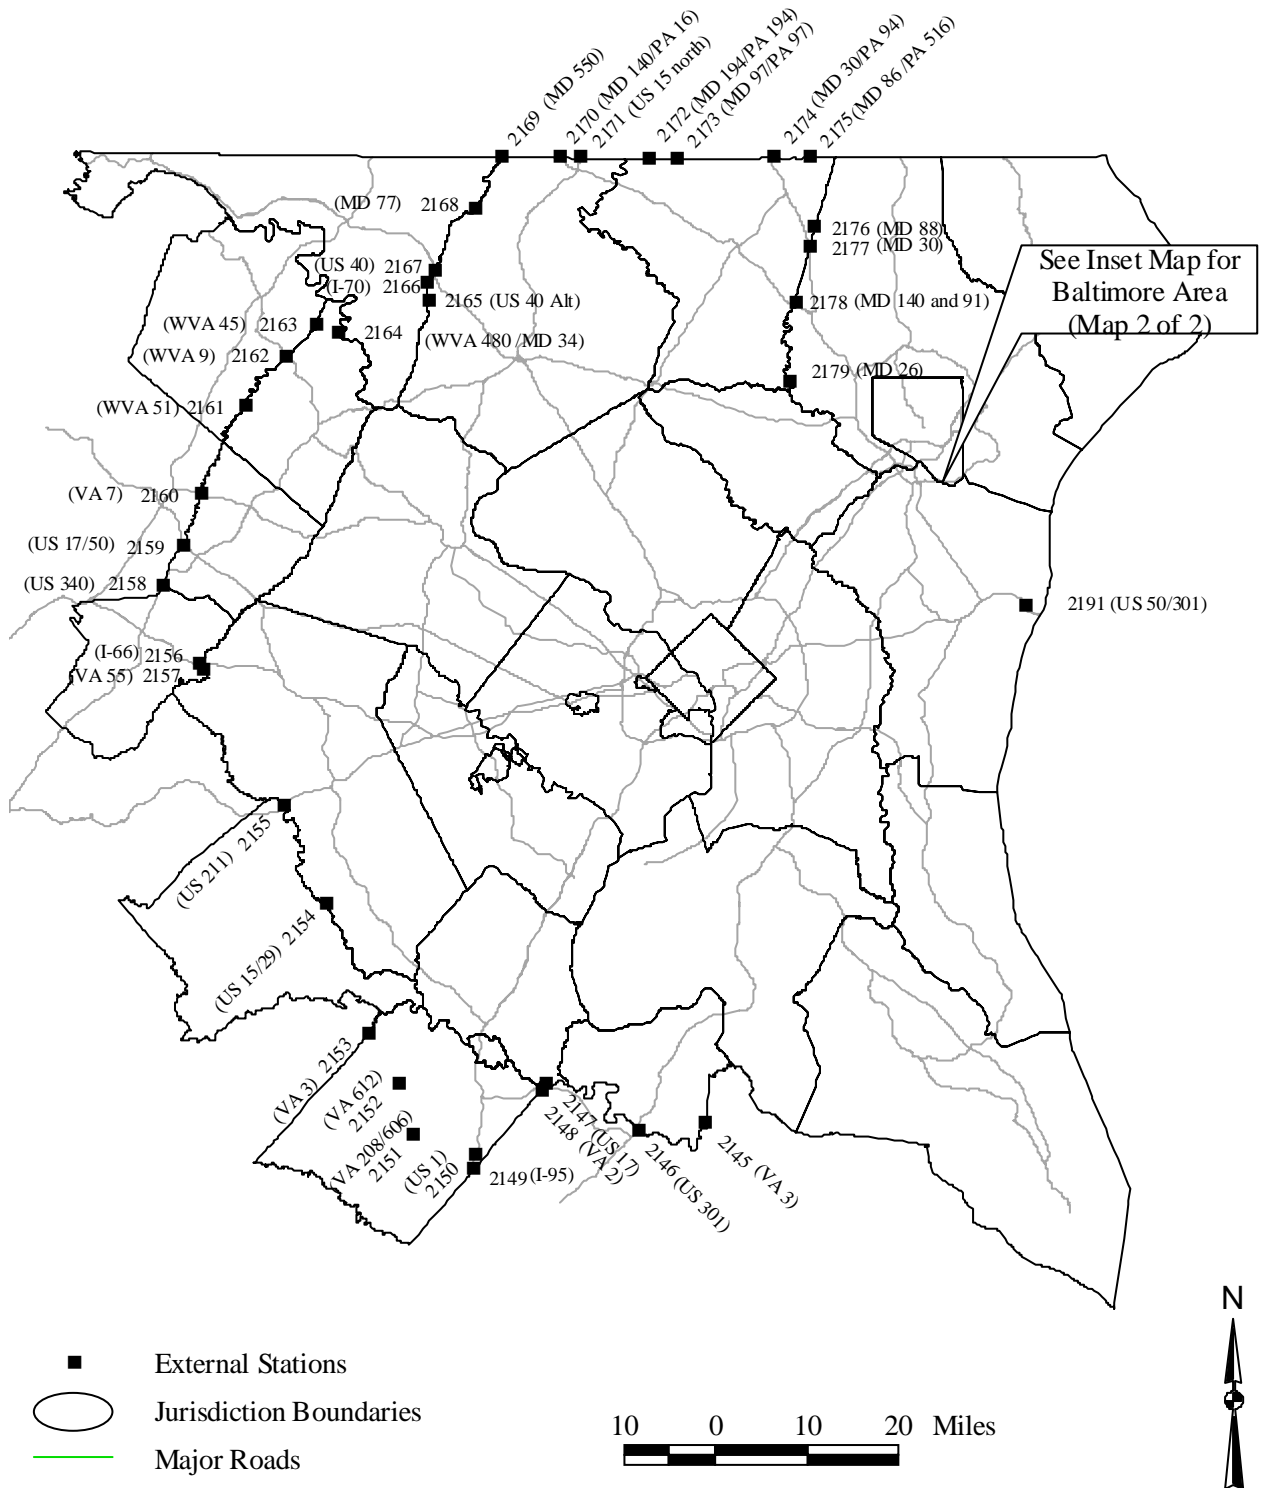

A network node numbering system was established for the expanded cordon highway and transit networks in 1997 as a way to locate nodes and minimize the mistaken use of the same nodes in multiple locations. The node numbering system is revised yearly as nodes are added for network updates.

Highway node ranges have been developed by jurisdiction, and are further distinguished by general use facilities and special HOV facilities. The current highway node ranges are summarized in Exhibit 1-4. Node ranges corresponding to transit network elements (rail stations nodes, parking lots nodes) are shown in the exhibit, as are recommended node ranges for future network development.

2 Overview of Facilities Coded in the Networks Representing the 2004 CLRP and the FY 2005-2010 TIP

The Constrained Long-Range Transportation Plan (CLRP) is the long-term plan for transportation projects in the Washington metropolitan region. The plan is financially constrained to include only those projects that can be funded by revenues that are "reasonably expected to be available" as required by federal law and regulations. The plan extends at least 20 years into the future.

The currently adopted CLRP extends to 2025 and was amended on July 31, 2003. Consequently, it is often referred to as the "2003 CLRP."¹ The Transportation Improvement Program (TIP) is a six-year subset of the CLRP that represents the first six years of the CLRP. The current TIP is for fiscal years 2004 to 2009.² The latest air quality conformity assessment was conducted using the current CLRP and TIP.³ The CLRP must be updated at least once every three years. Recently, the practice has been to update the CLRP annually, since the TIP is being updated annually and the TIP is a subset of the CLRP.

Network coding for the new conformity cycle has been completed. This activity normally occurs in March, but began in May. The development of highway and transit networks and supporting data files employed in the analysis of the FY2005-2010 TIP and 2004 CLRP had progressed through the forecast year 2015 at the end of June. Due to the extensive debate by the TPB on the inclusion of the Inter County Connector element in the CLRP and TIP update, and the decision to code both the Master Plan and Northern Alignments in the forecast networks, work was completed for the years 2025 and 2030 in early FY2005.

2.1 Highways

At a minimum, the highway networks include all regionally significant roads, i.e., all freeways, interstates, and expressways in the modeled area, all arterials, most collectors, and some local roads. In many cases project inputs could not be coded into a regional network since such projects did not involve changes in capacity (e.g., highway rehabilitation, bridge reconstruction) or were too small to show up at the regional level (e.g., intersection improvements, improvements to a facility which is not contained in the regional networks).

The number of directional (one-way) links in the base-year (2000) network is about 18,000, which corresponds to about 12,000 link miles and 19,000 lane miles. Additional network statistics are shown in Exhibit 2-6, for forecast highway and transit networks employed in the analysis of the FY2005-2010 TIP and 2004 CLRP

¹ The written documentation for the CLRP is prepared every three years or so. The latest is 2000 *Update to the Financially Constrained Long-Range Transportation Plan for the National Capital Region*, MWCOG, May15, 2002.

² Note that the dates associated with the TIP are fiscal years and the dates associated with the CLRP are calendar years.

³ MWCOG, *Air Quality Conformity Determination of the 2003 Constrained Long-Range Plan and the FY 2004-2009 Transportation Improvement Program for the Washington Metropolitan Region*, December 31, 2003.

A listing of all highway projects that are included in the five network scenarios (years) is shown in Appendix A, and Exhibit 2-1 shows significant changes for the 2004 CLRP as compared to the 2003 CLRP for projects inside the TPB planning area. Projects outside the TPB planning area are shown in Exhibit 2-2.

Exhibit 2-3 shows some of the major highway improvements (facility type 2 and above) coded in the networks representing the 2004 CLRP and the FY 2005-2010 TIP and is divided into five sections, one per network year. Please note that Exhibits 2-1 and 2-2 are a subset of Exhibit 2-3.

The first section of Exhibit 2-3 is for the year 2000. The three projects listed are an example of those highway improvements that are included in the year 2000 highway network. For example, in 2000, the Dulles Greenway (Eastbound) had been widened between VA 772 (Exit 6) and VA 28 (Sully Road). Construction of the VA 234 (Manassas Bypass) was completed in 2001.

In the 2005 section of the table, major highway improvements programmed for completion beyond those in the 2000 network are listed. As can be seen in the table, the 2015 network contains a large number of major projects that are slated for completion. Three major highway improvements are added in the 2025 network and two in 2030.

2.2 HOV Facilities

HOV facilities and improvements coded in networks representing the 2004 CLRP and the FY 2005-2010 TIP are shown in Exhibit 2-4. As can be seen in Exhibit 2-4, the year 2000 network includes HOV 3+ on I-95/I-395 from Quantico Creek (Route 234) in Prince William County to the Potomac River. The exhibit also includes HOV 2+ on I-66 from VA 234 near Manassas to the Potomac River and HOV 2+ on I-270 from MD 121 near Gaithersburg to the Beltway. Lastly, HOV 2+ is assumed on the Dulles Toll Road from VA 28 to the Beltway.

In the 2005 highway network, HOV 2+ operates on US 50 in Maryland from US 301 to just inside the Beltway. The existing roadway provides 6 conventional lanes and one HOV 2+ lane operating in both directions 24 hours a day. HOV operations began on US 50 in 2002.

Exhibit 2-4 shows planned HOV facilities for the 2015, 2025, and 2030 highway networks. Note that, as of 2010, all HOV facilities are assumed to operate as HOV 3+.

The majority of new HOV projects are implemented by 2015 and include: HOV lanes on I-66 from Route 234 (Sudley Road) to US 15 (Haymarket), an additional HOV lane on I-95/395 from Quantico Creek to the 14th Street Bridge, HOV lanes on I-95 from Quantico Creek in Prince William County to Route 610 in Stafford County, and HOV lanes on the Fairfax County Parkway from the Dulles Toll Road to I-66.

A complete description of highway and HOV projects contained in the 2004 CLRP and FY2005-2010 TIP, and modeled in highway networks developed during this fiscal year is listed in Appendix A.

	I-270 / US 15 Corridor	Construct	MD 121 to I-70	3+
2030	Same as 2030:			
	No new projects modeled			

Ref: FY0410Tip2005CLRPImprov.xls

2.3 Transit Service

The major transit facilities, services, and improvements coded in the 2004 CLRP and the FY 2005-2010 TIP transit networks are shown in Exhibit 2-5. The year 2000 network includes the full 103-mile Metrorail system. Commuter rail includes three MARC lines in Maryland (Penn, Camden, and Brunswick Lines), and two VRE lines in Virginia (Fredericksburg and Manassas Lines).

In the 2005 transit network, the Blue Line (Metrorail) is extended from Addison Road to Largo, and the New York Avenue Station is added to the Red Line (Metrorail). In the District of Columbia, a Light rail service begins operation between Pennsylvania Avenue SE. and South Capitol Street SE, and in the Dulles Corridor, existing express bus service is upgraded with elements of the BRT transit system. The 2005 network also contains an extension of MARC service from Point of Rocks to the City of Frederick Maryland (operations began in 2002).

The major transit improvements for the 2015 networks include the Potomac Greens Metrorail Station, Cherry Hill VRE Commuter Rail Station, the Bi-County Transit-way from Silver Spring to Bethesda, Dulles rail from East Falls Church Metrorail Station to Va. Route 772, the K Street Bus-way in the District of Columbia, and the first phase of the Corridor Cities Transit-way in operation from the Shady Grove Metrorail Station to Metropolitan Grove in Montgomery County.

In the 2025 transit network, the major improvements include the second phase of the Corridor Cities Transit-way in operation from Metropolitan Grove to the COMSAT center in Montgomery County, and the operation of bus lanes on Route 1 between Route 235 north and I-95 Capital Beltway in Virginia. A complete list of the projects included in the 2004 CLRP and the FY 2005-2010 TIP is shown in Appendix B.

Highway and Rail network statistics for improvements coded in the 2004 CLRP and the FY-2005-2010 TIP are shown in Exhibit 2-6, for the COG/TPB modeled area.

Exhibit 2-7 presents the geographic areas that are analyzed as a part of air quality conformity assessment. The map delineates the current COG/TPB modeled area, as well as the non-attainment or MSA area. Carroll, Howard, and Anne Arundel counties are members of the Baltimore Metropolitan Council (BMC) planning region. These areas are included within COG's modeled area to enable better simulation results within Montgomery and Prince George's Counties. Transportation projects were included for these two areas, provided through the coordination efforts of the Maryland Department of Transportation (MDOT) and the BMC. These counties are included within the travel demand at the MSA (non-attainment) level, but emissions within Carroll, Howard, and Anne Arundel counties are removed from the analysis. Inputs from Charles County and Calvert County are also provided by MDOT and are included in the analysis. An analogous situation exists in Virginia with Clarke, Fauquier, Spotsylvania, and King George counties, and in West Virginia with Jefferson County.

Exhibit 2-5: Major Transit Facilities, Services, and Improvements Coded in the 2004 CLRP and the FY2005-2010 TIP

Network	Facility/Service	Improvement	Limits
2000	Metrorail	(Existing)	Complete 103-mile system
	MARC, Penn Line	(Existing)	Union Station to Perryville, MD
	MARC, Camden Line	(Existing)	Union Station to Camden Station (Balt.)
	MARC, Brunswick Line	(Existing)	Union Station to Martinsburg, WV
	VRE, Manassas Line	(Existing)	Union Station to Broad Run Airport
	VRE, Fredericksburg Line	(Existing)	Union Station to Fredericksburg, VA
	VRE, Fredericksburg Line	(Existing)	Franconia/Springfield Commuter Rail Station
	VRE, Fredericksburg Line	(Existing)	Lorton Commuter Rail Station
	VRE, Fredericksburg Line	(Existing)	Cherry Hill Commuter Rail Station
Bus, Dulles Corridor	(Existing)	Route 772 in Loudoun to East Falls Ch. Metro	
2005	Same as 2000 base, plus the following:		
	Metrorail, Blue Line	Construct	Addison Road to Largo
	Metrorail, Red Line	Construct	NY Avenue Station
	Metrorail (Red) / MARC	Construct	Silver Spring Inter-modal Transit Facility
	Express Bus	Upgrade	Dulles Corridor (BRT elements)
	MARC, City of Frederick Line	Construct	Frederick to Point of Rocks
Light Rail	Construct	Pennsylvania Ave., SE to South Capitol St. SW	
2015	Same as 2005, plus the following:

3. Version 2.1 D #50 Model Network Files

This chapter describes the files that support network building and fare development of the “Version 2.1 D #50” model in greater detail. The model requires the development of a single highway network containing attributes that represent three time periods: the AM peak period (6:00-9:00 AM), the PM peak period (4:00-7:00 PM), and the off-peak period (all remaining hours of the day). Two transit networks representing AM peak hour and off-peak are also required. Transit frequencies for the AM peak hour are based on scheduled service occurring between 7 AM-7:59 AM¹. The off-peak period frequencies are based on service occurring between 10:00 AM-2:59 PM. Zone-level transit fares for both the AM and off-peak time periods are developed and used in the mode choice process. The process ultimately produces four total fare files representing walk/drive-access transit fares for the AM peak period and walk/drive-access transit fares for the off-peak period

The network and fare development process supporting the Version 2.1 D #50 model requires files, in text format, which support highway and transit network building/skimming and transit fare development. A list of the files and their associated network development steps is shown in Exhibit 3-1 and further discussion is provided in the Version 2.1 D #50 model User’s Guide. The following section describes an overview of the Version 2.1 D #50 model network building process and is followed by a compilation section of detailed format descriptions of each file.

Exhibit 3-1: List of Network Files Prepared for the Version 2.1 D #50 Model

	Input Type	Filename	Description	Text or Binary
1	Land use	ZONE.ASC	Zonal Land Use	Text
3	Network, highway	LINK.ASC	Highway Links	Text
4	Network, highway	NODE.ASC	Highway Node File	Text
12	Network, transit	MODE1-9AM.TP	AM Mode 1-9 Transit Lines	Text
13	Network, transit	MODE1-9OP.TP	Off-Pk Mode 1-9 Transit Lines	Text
28	Network, transit	STA_TPP.BSE	Rail Station/PNR File	Text
29	Network, transit	RAIL_LNK.BSE	Rail Links	Text
31	Network, transit	GISWKAAM.ASC	GIS AM Zonal Transit Access File	Text
32	Network, transit	GISWKAOP.ASC	GIS Off-Peak Zonal Transit Access File	Text
33	Network, transit	GISWKLAM.ASC	GIS AM Walk Link File	Text
34	Network, transit	GISWKLOP.ASC	GIS Off-Peak Walk Link File	Text
36	Network, transit	MFARE1.A1A	MFARE1 A1 Deck	Text
38	Network, transit	TAZFRZN.ASC	TAZ/Bus Fare Zone Equivalency	Text
39	Network, transit	BUSFARAM.ASC	MFARE2 AM Bus Fare Zone Matrix	Text
40	Network, transit	BUSFAROP.ASC	MFARE2 Off-Peak Fare Zone Matrix	Text

¹ In the case of express bus service, which generally originates in the outer reaches of the study area and begins much earlier than 7 AM, the AM peak period definition is relaxed to earlier hourly period for which service is most concentrated.

3.1 Highway Network Building Overview

The Version 2.1 D #50 model/TP+ network building process begins with the creation of a single binary highway network containing AM, PM, and off-peak highway network attributes that is developed from a single highway link attribute file, which includes directional link attributes that vary in accordance with the actual highway operations in effect for each time period.

Network building also requires a node file containing the x/y coordinate units of each highway node, based on the NAD83 system in whole feet. The highway link attribute and node files are generated simultaneously in COG's GIS-based highway development (GBHD) process that employs a listing of TIP and CLRP projects to update a base year highway network in ASCII or text format. A project identifier (the link variable Proj_ID) is used to link the TIP/CLRP project listing to highway network links. The process generates networks for any year specified by the user and can generate two scenarios per network year. Highway link distances are also calculated in the process, in feet and based on Arcs contained in our Tiger centerline street base file, datum NAD83, projection: MD State Plan, Units: feet.

Highway operations are represented on the basis of lanes coded and highway operation (or *limit*) coding. Hence, each link is assigned three lane codes and three limit codes, corresponding to each modeled time period. During network building, each appropriate lane and limit value is selected in the creation of the three files. The operation changes represented in the highway network are those of regional significance. These include facilities that convert from two-way to one-way operations and/or facilities that change in lane configuration during peak traffic periods.

Special HOV facilities, truck prohibitions on parkway facilities, and facilities that are added to the networks to enable transit routes to be coded accurately, relative to zonal activity centers are also reflected using limit codes. There are numerous cases in the Washington region where through traffic is prohibited from entering into residential neighborhoods during peak periods. These types of prohibitions are typically not of regional significance, and therefore, are not explicitly coded in the highway network. The limit codes employed in Version 2.1 D #50 model/TP+ highway networks are presented as follows:

<u>Limit Code</u>	<u>Vehicles Allowed</u>	<u>Vehicles Disallowed</u>
0	All Vehicles	No Vehicles
2	HOV 2+ Occ. Vehicles	1-Occ. Vehicles, Trucks
3	HOV 3+ Occ. Vehicles	1 / 2 Occ. Vehicles, Trucks
4	All Vehicles	Trucks
5	Airport Passenger Auto Driver Trips	All other Vehicles
9	Transit Only	All other Vehicles

FY-2004 Network Documentation: Highway and Transit Network Development

Special HOV facilities are coded based on their time-of-day operation. An example of highway network coding for the AM peak period is described below and a schematic diagram is provided in Exhibit 3-2.

In Exhibit 3-2, the I-66 segment from the Fairfax County Parkway to VA Route 645 Stringfellow Road provides 8 conventional lanes during non-peak periods. During the peak periods, the median lane operates as a concurrent HOV2 lane in the peak direction.

In the schematic diagram, link 15867-10299 operates 4 LOV lanes eastbound with a Limit Code 0 (all traffic permitted) and link 10294-10292 operates as 1 HOV lane and Limit Code 2 (HOV 2+ vehicles only). Westbound, link 10754-15866 operates with 4 LOV lanes and Limit Code 0 (all traffic permitted) and link 10291-10293 as 1 HOV lane and Limit Code 9 (all vehicles prohibited). Although transit service is permitted on links with Limit Code 9, transit service is not coded on I-66's westbound HOV links and this condition applies to all HOV facilities coded with a Limit Code 9 in the non-peak direction.

The highway networks typically include facility type and area type codes upon which free-flow speeds and hourly capacities are established during traffic assignments. Facility type codes are based on 7 categories (0/centroid connectors, 1/freeways, 2/major arterials, 3/minor arterials, 4/collectors, 5/expressways, and 6/freeway-arterial ramps) and are manually coded on a link-by-link basis.

The facility type 6 code for freeway-arterial ramps was added to networks in FY2003 to meet a Mobile6 model requirement for the calculation of ramp-specific emissions for high-type facilities. Ramps linking one interstate to another, which are generally designed to allow a smooth flow (without much acceleration or deceleration), were not identified with the facility type 6 code, and thus were not included in the ramp VMT. The VMT from these interstate-to-interstate ramps are included as interstate miles in summary tables of such information.

Free-flow speeds and hourly capacities are established during traffic assignments based upon facility type and area type codes. Area types are assigned during the Version 2.1/TP+ network building process, on the basis of employment and population density of the TAZ that is nearest to the link. Area type codes range in value from 1 to 7, as indicated in Exhibit 3-3.

The determination of the nearest TAZ, the density calculations, and subsequent area type value assignment are undertaken with a series of computer programs. Therefore, a zonal land use file containing land area and land activity information must be provided. A coordinate file is also necessary in order to enable graphical viewing of the network and to perform a number of other modeling tasks, which require information regarding network node positions.

Exhibit 3-2: Year 2000 Highway Network (AM Peak Period)

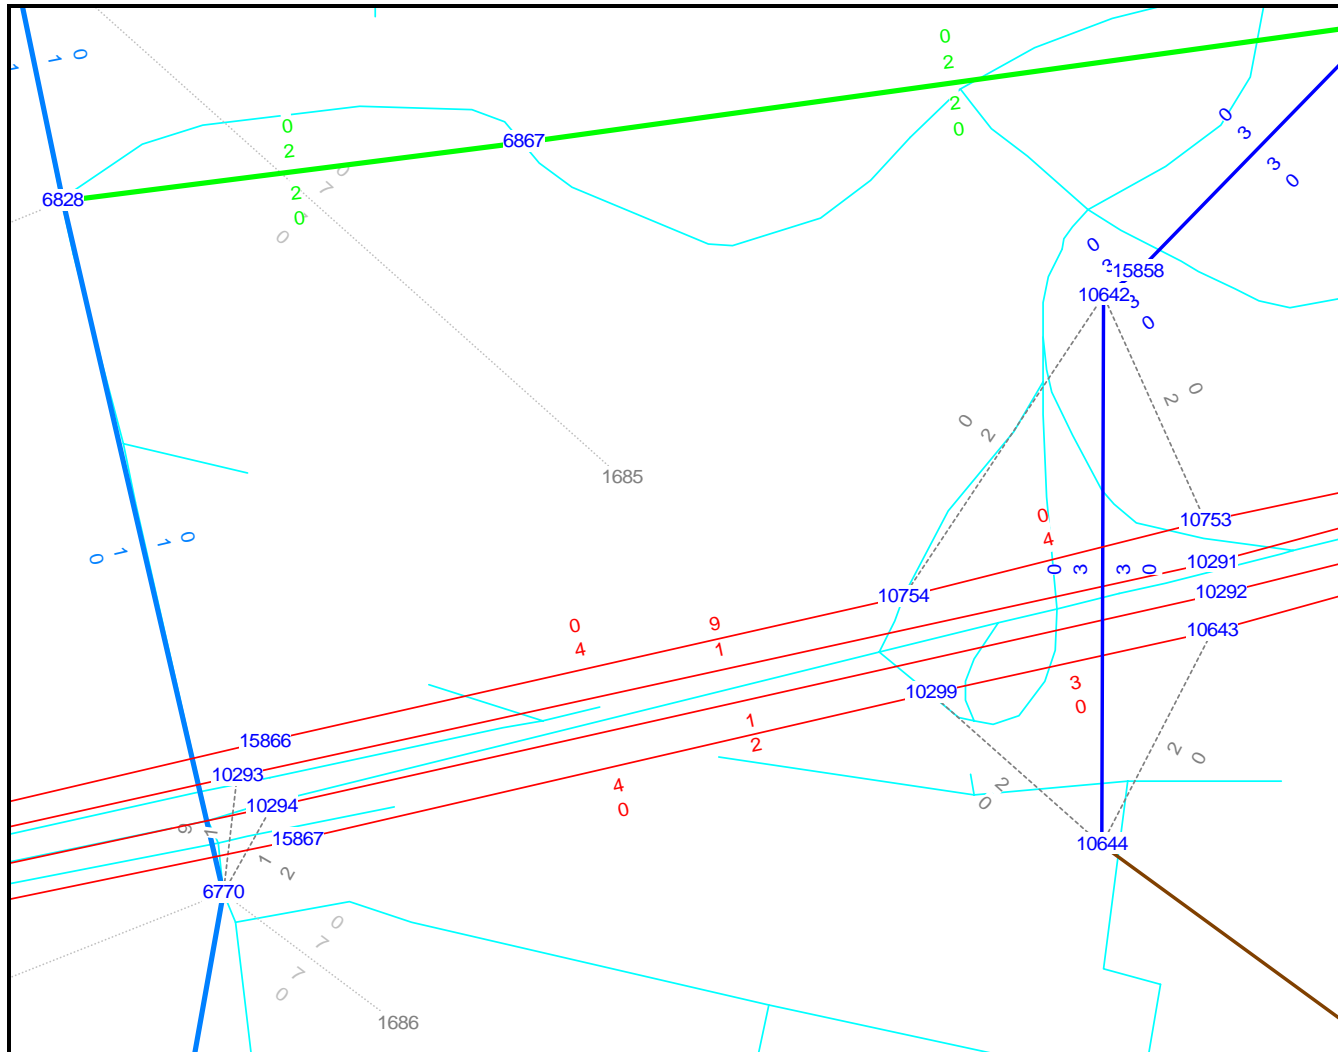

Exhibit 3-3: Highway Network Area Type Definitions (the relationship between link area type values and land use density)

One-Mile 'Floating' Pop. Density (Pop/Sq mi.)	One-Mile 'Floating' Employment Density (Emp / Sq mi)						
	0-100	101-500	501-1,500	1,501-5,000	5,001-15,000	15,001-35,000	35,001+
0-100	7	7	5	5	2	2	2
101-350	7	5	5	5	2	2	2
351-1,500	6	6	5	5	2	2	2
1,501-3,500	6	6	4	3	2	2	2
3,501-6,500	4	4	3	3	2	2	1
6,501-10,000		3	3	3	2	2	1
10,001+	3	3	3	2	2	2	1

A toll modeling capability has been added to the model so that monetary values are considered in the trip distribution and traffic assignment steps. The network link file now contains a toll value variable (TOLL) and a toll facility type variable (TOLLGRP) whereby tolls can be specified as a fixed fee or per-mile rate. The capability involves converting monetary toll values to an equivalent time that is, in turn, added to the normal highway time, therefore affecting highway pathbuilding. The FY2005-2010 TIP and 2004 CLRP highway networks model the ICC facility as TOLLGRP 4 and remaining toll facilities in the region as TOLLGRP 1.

Three parameter files, TOLL.INC, TOLL.ESC, and TOLL.SKM, are to be used to specify various toll policies. The TOLL.INC file is used in the trip distribution process and converts tolls on an I-J basis to equivalent minutes by income level. This file is generally unchanged by the user. The TOLL.ESC file is called in the highway network building program and is used to convert the link coded toll value from the current year costs to base year 1994 costs. The file may optionally be used to specify per mile toll rates and/or time period adjustment rates if desired. The TOLL.SKM file is called in the highway assignment and highway skimming steps and is used to convert link specific tolls to equivalent minutes. These equivalent minutes are added to the highway time as part of pathbuilding. The file may optionally used to specify toll adjustments by vehicle, time period, and toll group if desired.

Cost components in the Version 2.1 C model were previously developed in constant 1980 dollars. Alternatively, the #50 model requires costs to be expressed in 1994 dollars. 1994 was the base year of the model calibration. These components include parking costs, highway tolls, and transit fares. All deflation factors in the model (i.e., in the highway building and transit fare building steps) are used to convert current-year costs into base-year 1994 costs.

FY-2004 Network Documentation: Highway and Transit Network Development

Tolls codes indicate the out-of-pocket costs charged for the use of specific highway links. The tolls are codes expressed in current year dollars. Three tolled facilities are coded in the year 2000 highway network: the Dulles Toll Road (VA 267), the Dulles Greenway, and the Harry W. Nice Memorial Bridge (between Charles County, Maryland and King George County, Virginia). Although a toll is levied on the Chesapeake Bay Bridge (Eastbound), no toll has been coded since the facility is located at an external station.

The Dulles Toll road involves both access and egress tolls which vary by location. The entry charge at the east-most end of the facility is 50 cents, levied in both directions. A toll charge of 25 cents is charged at all west bound off-ramps and eastbound on-ramps, except for the Sully Road (Route 28) exit, where 35 cents is charged for the same movements. A toll of \$1.00 is coded on the Nice Bridge, in both directions.

The Dulles Greenway tolls are coded in COG networks based on the rates effective 4/17/00 and are actually the *average* of the cash rates and “SmarTag” rates. This assumes that the “SmarTag” market accounts for roughly half of all Greenway users.

The 14 mile Greenway connects to the Dulles Toll Road at Route 28 at the Dulles International Airport and extends west to Route 15 at Leesburg. The main toll facility is represented north of the Route 28 interchange with a toll of \$1.88. This toll applies to cars only and represents an average of \$2.00 cash and \$1.75 for Smart Tag. A toll of \$1.53 is used for all westbound and eastbound on-ramps at Routes 28, 606, and 607. A toll of \$1.00 is coded for all westbound and eastbound on-ramps at Routes 772, 659, and Claiborne Parkway. Toll information was furnished by state DOT's. A listing of highway network links where tolls are coded is shown in Exhibit 3-4.

The observed traffic (coded in thousands) is derived from 2000 average annual weekday traffic (AAWDT) counts that were solicited from four states for the various jurisdictions in the COG region. HPMS reported VMT was also used in the development of traffic counts. What follows is a summary of the count sources and assumptions used to derive counts for the various jurisdictions in the COG region. District of Columbia traffic counts were obtained from the DC Department of Public Works². Traffic counts coded in Maryland were obtained from the Maryland Department of Transportation (MDOT)³. Prince Georges County provides counts for secondary roads. The Virginia Department of Transportation (VDOT) provided traffic counts for primary and secondary roads⁴. Arlington County also provided counts, which were used to supplement VDOT counts. Traffic counts for West Virginia were obtained from the West Virginia Department of Transportation (WVDOT)⁵.

²District of Columbia, Department of Public Works, Bureau of Traffic Services.

³MDOT, State Highway Administration.

⁴VDOT, Traffic Engineering Division.

⁵West Virginia Division of Highways, Planning Division, Jefferson County.

Ref: TOLLNK02.xls

Highway link attributes also include a screen-line code. Screen-lines are used for comparing trip and vehicle crossings during model calibration and validation purposes. The Version 2.1/TP+ network includes 38 screen-lines throughout the modeled area and the current system of screen-line codes is shown as Exhibits 3-5 and Exhibit 3-6. Screen-lines 21 and 30 are not used.

Map 2 of 2**

3.2 Transit Network Building Overview

The AM and off-peak transit line files are established ‘over’ the AM and off-peak highway networks, respectively. The highway network contains some links that are coded below the grain of the TAZ system, so that the proximity of transit service to zonal activity centers can be more accurately represented⁶.

In accordance with the requirements of the mode choice model, both ‘walk access’ and ‘drive access’ versions of both the AM and off-peak networks are prepared. MWCOG transit line files are generally developed using mode codes, which designate a specific provider (or provider group). During FY2004, a new mode code “5” was designated to represent light rail service at the request of local and state transportation agencies staffing the Regional Mobility and Accessibility study. Exhibit 3-7 presents a summary of in-vehicle and out-of-vehicle mode conventions.

Because of the size and complexity of COG’s transit networks, the prospect of manually coding the various access-to-transit and transfer links associated with transit networks is especially onerous. To facilitate coding requirements, several automated procedures are used as part of the transit network building process, to enable automatic generation of auxiliary transit links, including walk-connect links, auto-connect links, transfer links, and downtown walk links.

As a result of the automatic link generation, the analyst must develop only two file types, transit line files and a single station/PNR file. The station/PNR file contains a list of all rail stations and park-and-ride lots (both existing and future) included in the transit network. It also contains an array of information that is associated with each station, including bus transfer nodes and the nearest TAZ. A description of the station/PNR File Format can be found in Exhibit 3-27.

It is assumed that travelers access the transit system by either walking or driving an auto, so zone centroids are connected to the transit system via a series of walk-access links and drive-access links. If a traveler accesses the transit system by auto, the traveler must go via a designated park-and-ride (PNR) lot, so these drive-access links are also called PNR access links.

An automated procedure is used to generate drive-access links for both the peak and off-peak time periods. In the past, such as for the Version 2.0/TP+ model, we generated up to four drive-access links, for each zone, to the four “closest” rail or bus station’s park-and-ride lot. However, using such a procedure (“best N stations”) can lead to a phenomenon known as the “transit paradox,” when one applies the procedure to multiple network scenarios (years). The classic example of the transit paradox is a case where a major rail extension is added to a network, but the extension results in a *loss* in transit trips for some zones, instead of the increase that would be expected.

⁶ The sub-zonal highway links used to more accurately reflect transit route alignments are disallowed from use during normal highway path building and highway assignments, however.

Exhibit 3-7: Summary of Version 2.1 D #50 Model Transit Mode Codes

In-Vehicle Mode Codes			
Mode No.	Mode Description	Abbreviation/Prefix	Transit Service
1	Local Metrobus	"1 - 97, A - Z"	WMATA (DC, ALEX. & MTG, PG, ARL, FFX Counties)
2	Express Metrobus	"5 - 29"	WMATA (ARL, ALEX, FFX)
3	Metrorail	"MRED"	RED Line
		"MBLU"	BLUE Line
		"MGRN"	GREEN Line
		"MORN"	ORANGE Line
		"MYEL"	YELLOW Line
		"MDULL"	DULLES Line
4	Commuter Rail	"FRED"	Frederick Line (VRE)
		"MASS"	Manassas Line (VRE)
		"MBRU"	Brunswick Line (MARC)
		"MCAM"	Camden Line (MARC)
		"MPENN"	Penn Line (MARC)
		"MFRED"	Frederick City Line (MARC)
5	Light Rail	"MTGLRT"	Georgetown Branch Light Rail (MTA)
		"LRTDC"	Anacostia Light Rail Line (DDOT / WMATA)
		"CCTLRT"	Montgomery Co. Corridor Cities Light Rail Line (MTA)
6	Other Primary - Local Bus	"ART"	Arlington County Bus
		"DAT"	City of Alexandria Bus
		"F"	Fairfax County Bus
		"GO"	Prince Georges County Bus
		"RO"	Montgomery Co. Ride On Bus
		"SG"	Fairfax City Bus
		"TYSL"	Tyson's Circulator
7	Other Primary - Express Bus	"DAT"	City of Alexandria Bus
		"F"	Fairfax County Bus
8	Other Secondary - Local Bus	"CC"	Calvert County Bus
		"FT"	Frederick County Bus
		"HT"	Howard County Bus
		"L"	City of Laurel Bus
		"LT"	Loudoun County Local Bus
		"OL"	OMNI-LINK (PrinceWilliam Co. Local)
		"VG"	Charles County Bus (VanGO) Note: will be added for FY2005
9	Other Secondary - Express Bus	"LCS"	Loudoun Co. Commuter Bus
		"LINK"	Washington Flyer- Dulles/WFC
		"MT"	Maryland MTA Bus (Frederick, Howard, Anne Arundel, Calvert, St Mary's, & Charles Counties)
		"OR"	OMNI-RIDE (PrinceWilliam Co. Commuter Bus)
		"PQ"	Quicks Commuter Bus (Fredericksburg, Spotsylvania & Stafford Counties)
		"SDC"	Nat'l Coach Commuter Bus (Fredericksburg, Spotsylvania & Stafford Co's)
Out-of-Vehicle Mode Codes			
10	(Unused)		
11	Drive Access Links

FY-2004 Network Documentation: Highway and Transit Network Development

The paradox is caused by inconsistent coding of transit access links, usually drive-access links, where, instead of simply adding new drive-access links that are associated with the rail extension, the modeler both adds some drive-access links and removes some existing drive-access links.

The removal of some links usually occurs at end-of-the-line stations that, because of the extension, are no longer end-of-the-line stations. Thus, in adding the new rail extension, some drive-access links that existed in the base scenario were removed by the modeler (or modeler's software) as the rail line is extended, instead of simply adding new drive-access links in addition to the existing ones. The result is that, for some interchanges, the drive-access transit travel time goes up and transit trips are reduced, despite the addition of the transit service.

To minimize the occurrence of the transit paradox, we developed a new routine for generating drive-access links that is based on one or more set distances from each zone. Specifically, two conditions apply:

1. The straight-line distance from a zone to a PNR lot must be: (1) within 4 miles for DC, Arlington Co., and Alexandria; (2) within 5 miles for Montgomery Co., Fairfax Co., and Prince George's Co.; and (3) within 8 miles for all remaining jurisdictions.
2. Zone to PNR connections will not cross the Potomac River, except for origin zones in Loudoun Co. and Jefferson Co., since the MARC commuter rail system in Maryland does serve commuters from those jurisdictions.

One other enhancement used in automated coding of drive-access links in the Version 2.1 model involves the time and distance coded on drive-access links. Although drive-access links were always coded with a time and distance representing the over-the-road travel between the zone and the PNR, in the past, this time and distance were based on a lookup table of speeds.

Now, however, the time and distance values are updated based on the output speeds from the initial "pump prime" traffic assignment. This means that the times and speeds on drive-access links should reflect the fact that they will congest as roadway links congest. Further details can be found in the Version 2.1 D #50 model User's Guide, which discusses the automatic generation of both drive-access links and walk-access links.

A file containing Metrorail and Commuter Rail links (see Exhibit 3-28) is required in the transit building process. These link attributes consist of simply the a-node, b-node, distance and average speed. Metrorail and Commuter Rail link data is supplied by the Washington Metropolitan Area Transit Authority, Maryland's Department of Transportation, and Virginia's Department of Transportation.

FY-2004 Network Documentation: Highway and Transit Network Development

Transit line data is shown for the Metrorail system in Exhibit 3-8. The information is displayed for 1994, 2000, and 2025. The exhibit displays a COG transit line identifier, the origin and destination stations, and headways, run-times, line distances, and average line speed for service during the AM peak hour and Off-peak period.

Commuter Rail and Light Rail transit line data is shown in Exhibits 3-9 and 3-10. Rail line characteristics are displayed for 1994, 2000, 2005, and 2025. These exhibits also display transit line identifiers, origin and destination stations, and headways, run-times, line distances, and average line-speed for service during the AM peak hour and Off-peak period.

Automated calculation of transit headways: The “AM Peak and Off-Peak line files are text files containing information about transit lines, such as the headway, the run time, and the itinerary (i.e., the sequence of nodes taken by the transit vehicle as it travels its route).

Line files are time-of-day specific, so there is one set of line files for the AM peak period and one set for the off-peak period. “Headway” is the time between successive arrivals (or departures) of transit vehicles on a given route. “Run time” is the time in minutes that it takes for the transit vehicle to go from the start to the finish of its route and is a measure of the average speed of the vehicle on that route. In the past headways and run times were calculated manually from the paper timetables put out by the various transit agencies.

Since 1999, we have calculated headways and run times for WMATA bus routes and Ride On bus routes, which represent the lion’s share of transit routes in a given transit network, in an automated manner using electronic files from the transit agencies and SAS programs developed at COG. This has ensured consistency of transit networks across network years for WMATA bus routes and Ride On bus routes, something that is very important for correct use of travel demand models. The headways and run times for the remaining transit providers were calculated manually.

3.3 Transit Fare Building Process

Finally, a series of files is needed to support the fare building process. COG's transit fare process consists of two programs known as MFARE1 and MFARE2⁷, which operate in sequence to estimate Metrorail station-to-station fares and to estimate total (bus and rail) fares between TAZ. A more rigorous description of the MFARE1/2 processes can be found in Chapter 6 of the Version 2.1 D #50 model User's Guide.

The files needed to support the fare building process include a transit walk percent file, a zonal file indicating the equivalence between each TAZ and its associated bus fare district, a Metrorail network link file and coordinate file, and a bus-fare-zone to bus-fare-zone fare matrix.

Bus-fare-zone to bus-fare-zone fare matrices have been developed based on the WMATA tariffs in effect for the survey year 1994, validation network year 2000, and forecast year networks for 2005 through 2030. Fares for service outside the WMATA compact area are developed using passenger costs for transit available in each area. Descriptions of fare assumptions that were employed in the development of bus-fare-zone-to-bus-fare-zone fare matrices are presented in the following pages.

The bus fare matrices for 1994, year 2000, and 2005 through 2030 AM peak and off-peak periods transit networks were constructed using fare data for the WMATA compact areas and are based on the WMATA tariff in effect for the survey year, 1994 (Tariff #16, effective June 27, 1992), year 2000 (Tariff Number 19, effective June 1999), and years 2005 through 2030 (Tariff Number 23 effective June 2004). The fares are provided in cents for the year that the Tariff was in effect. The least expensive fares available are used to reflect what the majority of regular work trip commuters would pay and are averaged for areas with multiple services. Fares for MARC, VRE, and other transit providers are the same for the peak and off-peak and are based on those in effect during the year of the WMATA tariff. A description of the MFARE2 fare computation is presented in Appendix E of the Version 2.1 D #50 model User's Guide report (staff memorandum to the project file).

Exhibit 3-11 displays WMATA's Metrorail and bus fare policy for the peak and off-peak periods and control parameters for the MFARE1/2 programs. The table arrays fare policy as input to the MFARE1 and MFARE2 programs.

Since the development of the 1994 networks, the expanded cordons have been comprised of 21 bus fare zones that reflect transit service areas that are based on the WMATA tariffs in effect for the network year. Bus fare zones/service areas and fare matrices for Tariff #16 are described in Exhibits 3-12 through 3-15. WMATA's Tariff #19 information is shown in Exhibits 3-16 through 3-19, and Tariff #23 is shown in Exhibits 3-20 through 3-23.

⁷ *User's Guide for the MFCOG Fare Programs, Microcomputer Version* (Final). Originally prepared for the Maryland Department of Transportation by COMSIS Corporation, April 1991. Revised version prepared for the Metropolitan Washington Council of Governments, by William G. Allen, Jr., PE, June 1992.

Taken from “Tariff of the Washington Metropolitan Area Transit Authority for Metrorail and Metrobus operations within the Washington Metropolitan Area. Tariff 16 (effective June 27, 1992), Tariff 19 (effective June 20, 1999), and Tariff 23 (effective June 28, 2004)

WMATA Tariff #16, effective in June 27, 1992 was employed in building fare matrices for the use with 1994 transit networks. The bus fare service areas/zones for WMATA Tariff #16 are described in Exhibit 3-12. Bus fare zones/service area maps and AM and Off-peak period fare matrices are described in Exhibits 3-13, 3-14, and 3-15.

FY-2004 Network Documentation: Highway and Transit Network Development

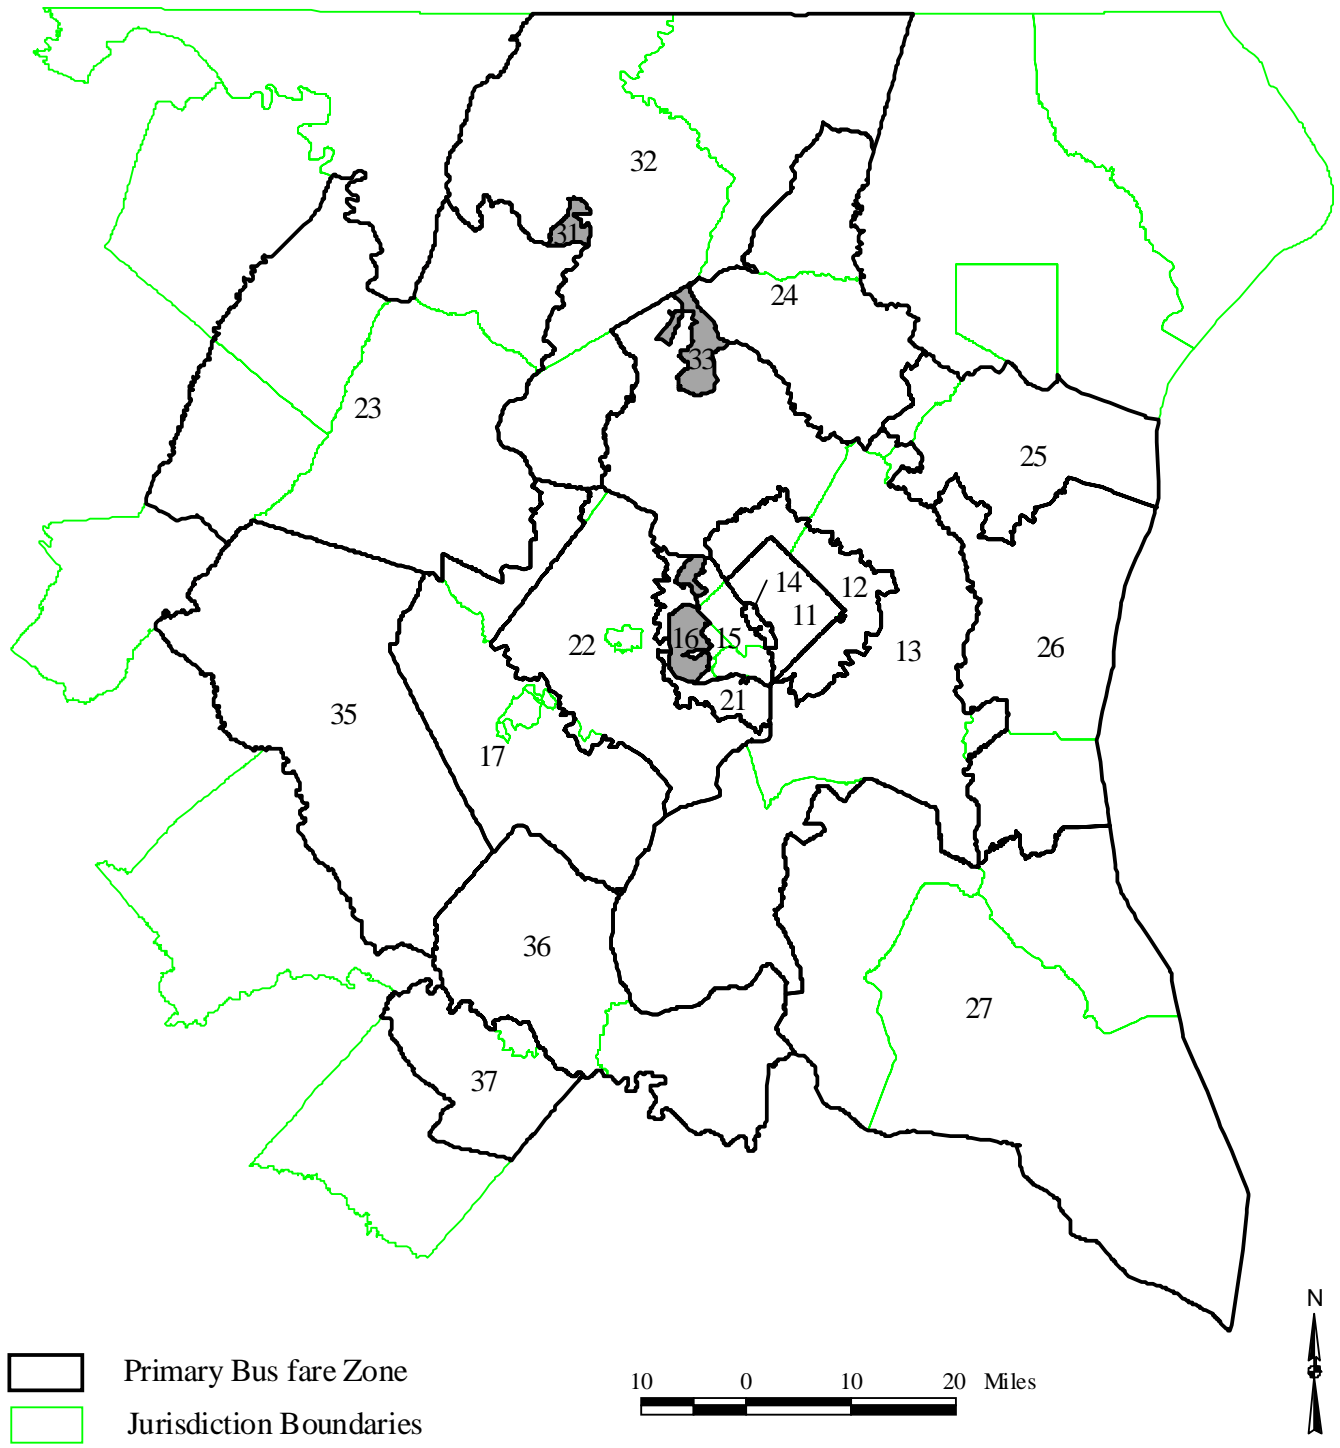

In 1994, the following modifications were made to the COG fare zone system to more accurately reflect conditions in respect to VRE fares:

1. Zone 2,3 (Frederick Co./ MARC) was assumed to extend to cover western Loudoun County as well as Clark and Jefferson Counties. Much of what little transit use is generated from this area is heavily MARC oriented.
2. Zone 3,4 fares were modified so that they reflected only the Lorton Station which actually opened during late 1994.
3. Fare zone 3,5 was redeveloped based on fares from the Quantico, Woodbridge, and Rippon Stations.
4. Two additional fare zones were established to reflect commuter rail opportunities in areas beyond Prince William County.
5. Zone 3,6 was used to reflect Stafford County stations, Brooke and Leeland Road (serving Stafford and King George Counties).
6. Zone 3,7 was used to reflect the Fredericksburg station (serving Spotsylvania County and the City of Fredericksburg). It is important to note that, commuter bus fares for bus fare zones 3,6 and 3,7 are averaged. These bus fares are relevant to trips destined to DC (1,1) and Virginia core (1,4).
7. Fauquier County is assumed to be VRE oriented, i.e. using the Manassas station.

Exhibit 3-12: Bus Fare Service Areas/Zones for WMATA Tariff #16

<u>1st Fare Zone</u>	<u>Bus Service</u>	<u>Approximate Service Area</u>
Fare Zone 1,1-	WMATA / DC	DC
Fare Zone 1,2 -	WMATA / MD Zone 1	"Inner" Maryland Suburbs
Fare Zone 1,3 -	WMATA / MD Zone 2	"Outer Maryland Suburbs
Fare Zone 1,4 -	WMATA / VA Zone G	Virginia "Core"
Fare Zone 1,5 -	WMATA / VA Zone 1	"Inner" Virginia, beyond the Core
Fare Zone 1,6 -	WMATA / VA Zone 2	Virginia Suburbs, beyond Zone 1
Fare Zone 1,7 -	WMATA / VA Zone 3	Virginia Suburbs, beyond Zone 2
Fare Zone 2,1 -	FFX Connector / Zone 1	"Inner" Fairfax Co.
Fare Zone 2,2 -	FFX Connector / Zone 2	"Outer" Fairfax Co.
Fare Zone 2,3 -	MARC Rail / Brunswick	Frederick County, near MARC rail
Fare Zone 2,4 -	Howard Co. Commuter Bus	Howard Co.
Fare Zone 2,5 -	MARC Penn, Camden Lines	E. Howard Co./N. Anne Arundel Co.
Fare Zone 2,6 -	Ann Arundel Commuter Bus	Anne Arundel Co.
Fare Zone 2,7 -	Charles Co., Commuter Bus	Charles Co.
Fare Zone 3,1 -	Feeder Bus to MARC	Frederick to Pt. of Rocks Sta.
Fare Zone 3,2 -	MTA Commuter Bus	N. Mtg.Co, FrederickCo.,Carroll Co.
Fare Zone 3,3 -	MTA Commuter Bus	Upper Mtg. Co.
Fare Zone 3,4 -	VRE	Fairfax Co.
Fare Zone 3,5 -	VRE Rail Zones 5&6	Prince William/Fauquier Counties
Fare Zone 3,6 -	VRE Rail Zones 7&8	Stafford/King George Counties
Fare Zone 3,7 -	VRE Rail Zone 9	City of Fredericksburg/Spotsylvania

WMATA fares are based on Tariff #16 effective 6/27/92.
Remaining transit provider fares are based on those in effect during 1994, deflated back to 1992

In June of 1999, the Washington Metropolitan Area Transit Authority published a new tariff #19 for Metrorail and Metrobus operations. The Metrobus fare structure was changed to integrate the Metrobus and Metrorail system and foster seamless travel with other local transit providers. A flat fare of \$1.10 for Metrobus trips was created by eliminating all zone charges in Maryland and Virginia as well as eliminating interstate charges for trips traversing the regions major jurisdictions.

The new tariff also eliminated the 10-cent Metrobus transfer fee, reduced fares on regular and express Metrobus routes, cut most local bus fares, made transfers from Metrorail to Metrobus cost 25 cents, and honored Metrobus transfers on Montgomery County's Ride-On bus system, as well as other local bus systems such as DASH, Fairfax Connector, CUE, ART, Connect-A-Ride, and PRTC OmniRide.

The Metrorail fare structure features a regular fares and reduced fares by time-of-day, based on composite miles. Fares are provided in year 2000 cents (or the year that the tariff was in effect).

Fares for MARC, VRE and other transit providers are the same for the peak and off-peak. These fares are based on those in effect during 1999. The least expensive fares available were used to reflect what the majority of regular work trip commuters would pay. Fares were averaged for areas with multiple services. Exhibit 3-11 shows the basic peak and off-peak period fare policies addressed in the modeling procedures for tariff #19.

Bus fare zones/service areas were redesigned to reflect the new Metrobus fare tariff and changes in fares for the remaining transit providers in the modeled area. In addition to new bus fare zones/service areas, the new regional fare structure removed the need for separate matrices for peak period fares and off-peak period fares. This was made possible by creating a flat fare of \$1.10 for Metrobus trips by eliminating all zone charges in Maryland and Virginia as well as eliminating interstate charges for trips traversing the regions major jurisdictions.

The redesigned transit service areas are shown in Exhibit 3-16. Regional bus fare zone maps showing primary and secondary fare zones are displayed in Exhibit 3-17 and Exhibit 3-18, respectively. The bus fare service areas/zones matrix is shown in Exhibit 3-19.

(Expressed in 2000 cents)
Ref: BF19MTX.XLS

WMATA fares are based on Tariff #19 effective 6/20/99.
Remaining transit provider fares are based on 2000 information.

FY-2004 Network Documentation: Highway and Transit Network Development

In June of 2004, the Washington Metropolitan Area Transit Authority published a new tariff #23 for Metrorail and Metrobus operations. The new fare structure increased the base fare for Metrorail, from \$1.20 to \$1.35, a 5-cent increase for Metrobus from \$1.20 to \$1.25 and a 10-cent increase from \$2.40 to \$2.50 for MetroAccess.

Fares for MARC, VRE and other transit providers are the same for the peak and off-peak. These fares are based on those in effect during 2004. The least expensive fares available were used to reflect what the majority of regular work trip commuters would pay. Fares were averaged for areas with multiple services. The basic peak and off-peak period fare policies addressed in the modeling procedures are shown in Exhibit 3-11.

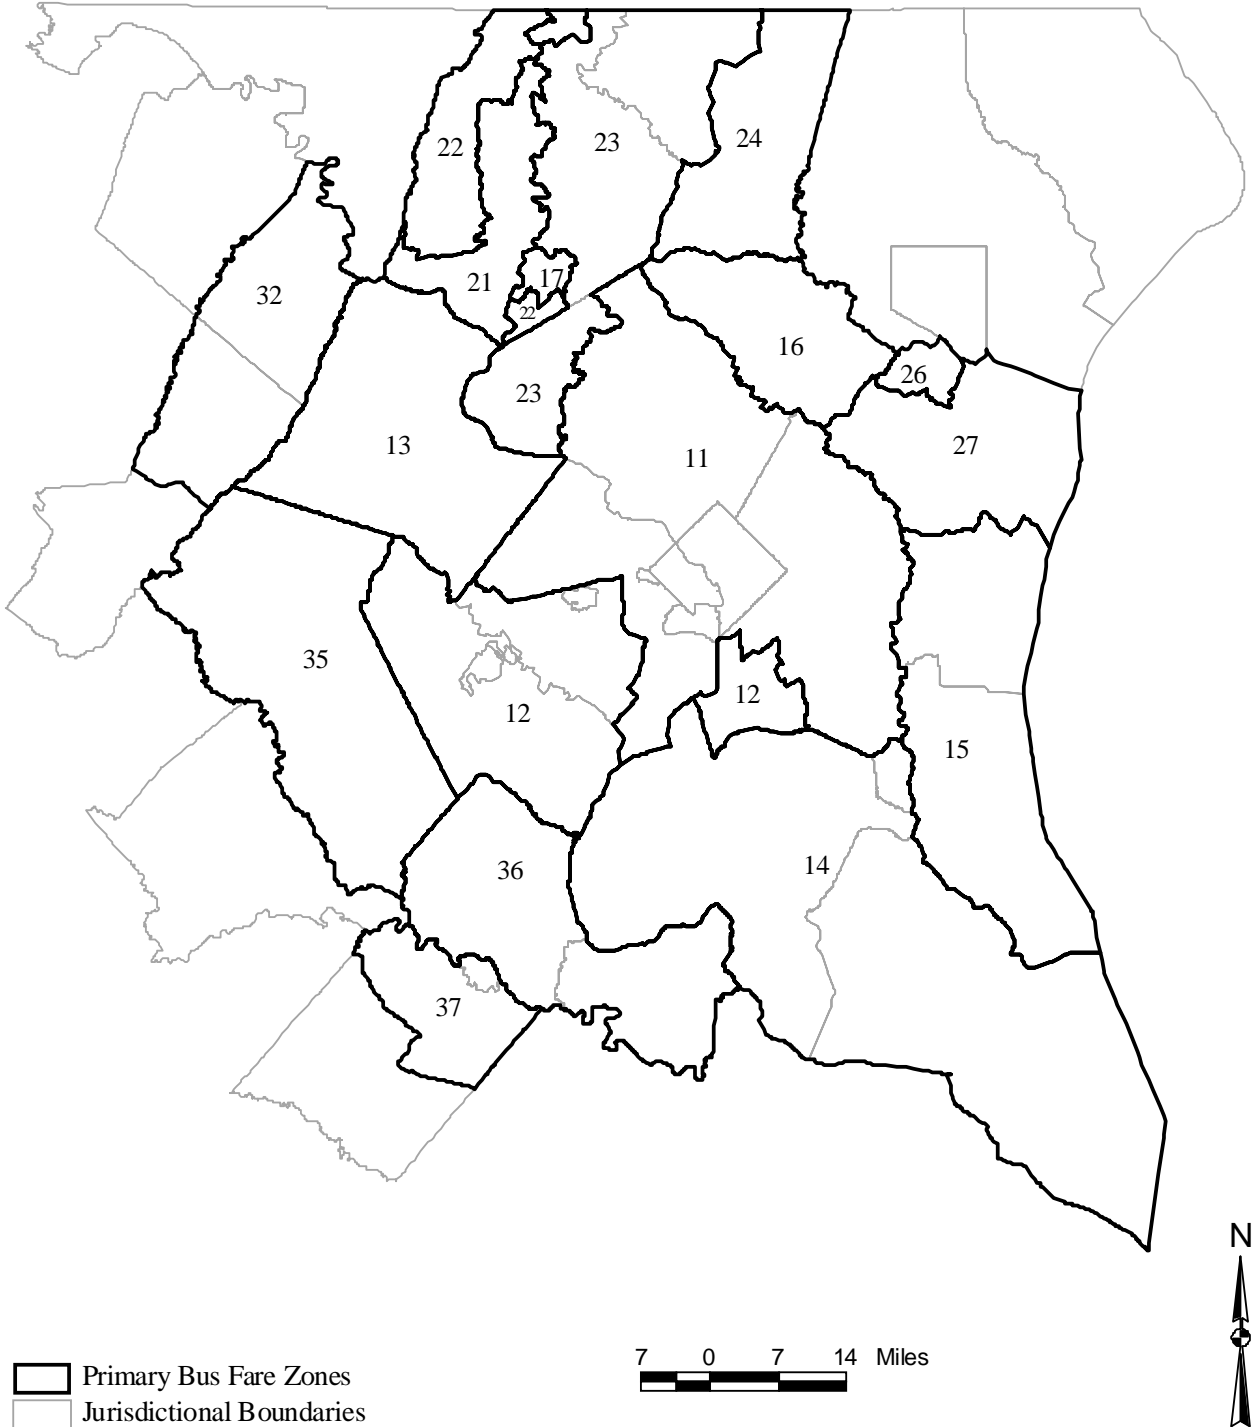

Future transit improvements in Montgomery County have been reflected in the COG fare zone system. Fare zone 1,7 now represents the addition of the Corridor Cities Transit-way and, rail and bus fares in that corridor. The bus fare matrix remains comprised of 21 fare zones that are described in Exhibit 3-20. Regional bus fare zone maps showing primary and secondary fare zones are displayed in Exhibits 3-21 and 3-22. The bus fare matrix for WMATA Tariff #23 is shown in Exhibit 23. Fares are provided in year 2004 cents (or the year that the tariff was in effect).

Exhibit 3-20: Bus Fare Service Areas/Zones for WMATA Tariff #23

<u>1st Fare Zone</u> <u>Bus/Rail Service</u>⁹	<u>Approximate Service Area</u>
Fare Zone 1,1 WMATA Regular Service	DC, MTG, PG, ALEX, ARL, & FFX
Fare Zone 1,2 WMATA Express & Special Fare Service, & OMNI	Inner Maryland, Fairfax Suburbs, & Prince William County
Fare Zone 1,3 Loudoun Commuter Bus Service	Loudoun County
Fare Zone 1,4 MTA Commuter Bus	Charles / St Mary's Counties
Fare Zone 1,5 MTA Commuter Bus	S. Anne Arundel / Calvert Counties
Fare Zone 1,6 MTA Commuter Bus	Howard County
Fare Zone 1,7 Corridor Cities Transit-way	Montgomery County
Fare Zone 2,1 Frederick Co Local Bus	Frederick County
Fare Zone 2,2 MARC Rail / Brunswick Line	W. Frederick / N. Loudoun Counties
Fare Zone 2,3 MARC Rail / Brunswick Line	MTG. Co. (Ring 8) / E. Frederick & W. Carroll Co.
Fare Zone 2,4 MARC Rail / Brunswick Line	MTG. Co. (Mid County) / W. Howard Co. & E. Carroll Co.
Fare Zone 2,5 MARC Rail / Brunswick Line	Montgomery Co. (Inner County)
Fare Zone 2,6 MARC / Penn, Camden Lines	NE. Howard /NW Anne Arundel Co.
Fare Zone 2,7 MARC / Penn, Camden Lines	SE. Howard/Anne Arundel Co. & NE. Prince Georges Co.
Fare Zone 3,1 MARC / Penn, Camden Lines	N. Central Prince Georges Co. & SW. Anne Arundel Co.
Fare Zone 3,2 MARC/Brunswick Line	Jefferson W.VA. & Clarke Co. VA.
Fare Zone 3,3 VRE Rail Zones 1&2	Inside Beltway
Fare Zone 3,4 VRE Rail Zones 3&4	Fairfax & Prince William Counties
Fare Zone 3,5 VRE Rail Zones 5&6	Prince William & Fauquier Counties
Fare Zone 3,6 VRE Rail Zones 7&8	Stafford & King George Counties
Fare Zone 3,7 VRE Rail Zone 9	City of Fredericksburg & Spotsylvania Co.

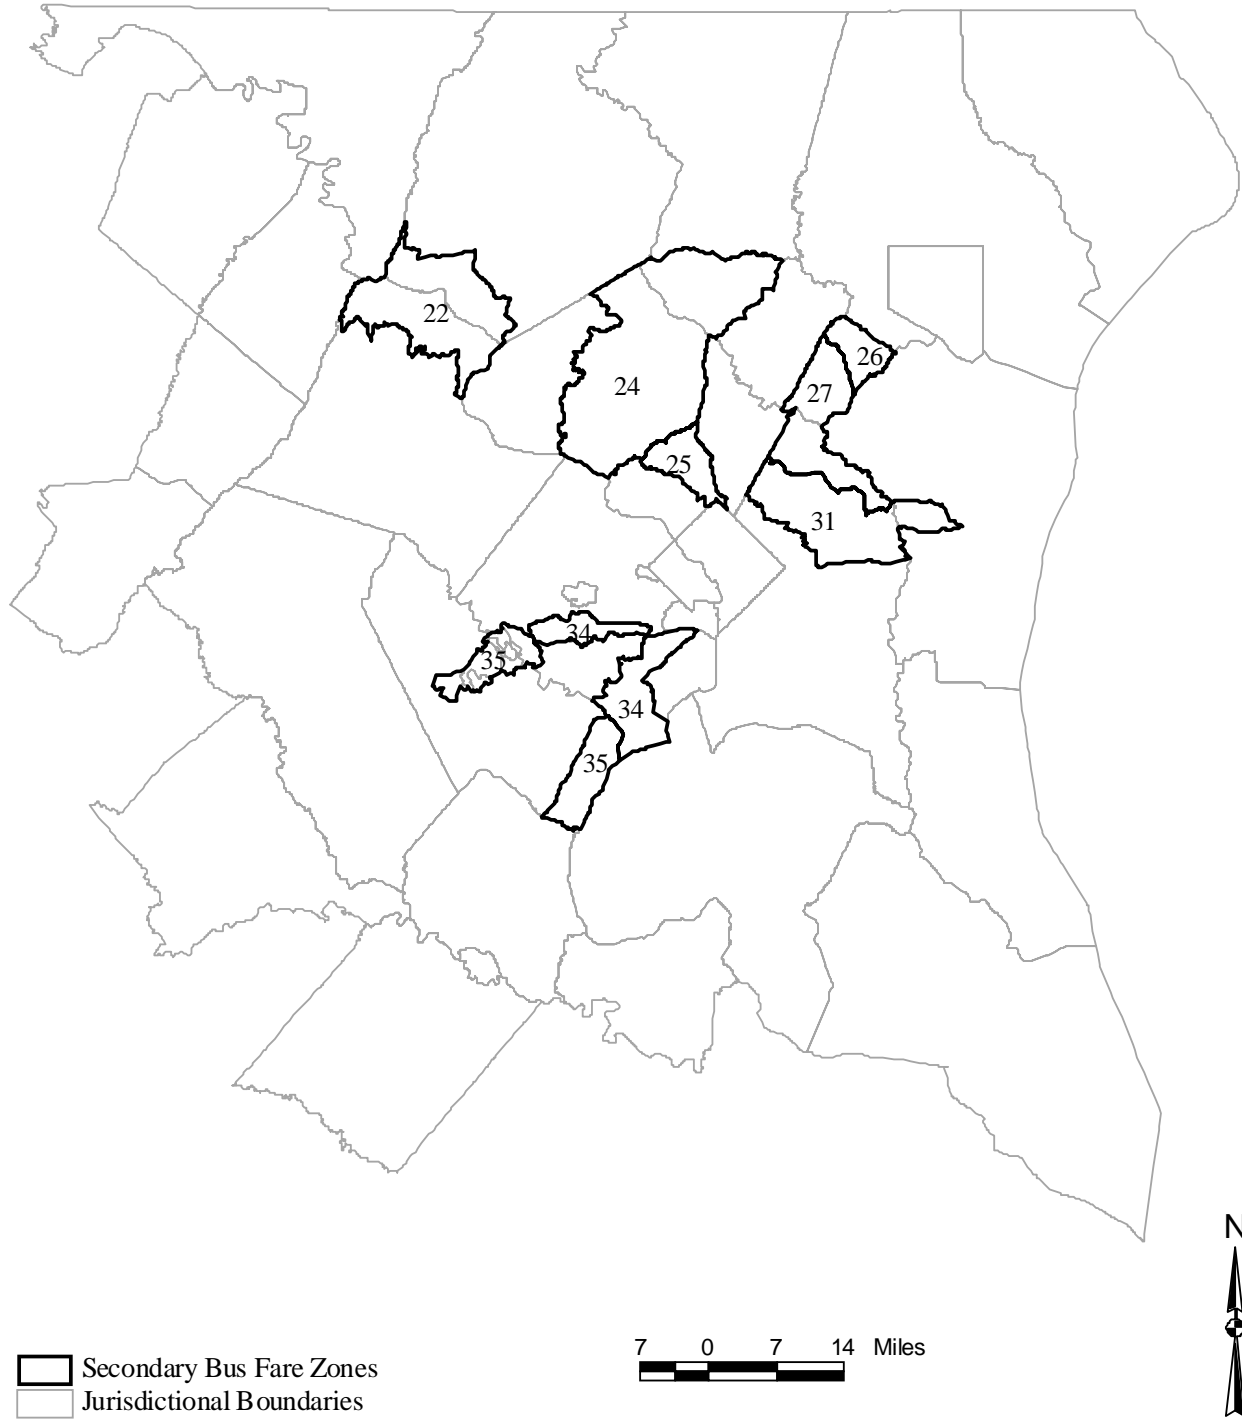

⁹This rail service includes MARC and VRE. Metrorail is not included, but is modeled in the RPFARE1 process.

Exhibit 3-21: Regional Primary Bus Fare Zone Map for Tariff #23

WMATA's Tariff Number 23 (effective June 2004)

WMATA fares are based on Tariff #23 effective 6/27/04.
Remaining transit provider fares are based on 2004 information.

3.4 File Format Descriptions of the Version 2.1 D #50 Network Files

The format descriptions are shown as Exhibit 3-24 to Exhibit 3-33. Finally, listings of network files that have been produced this fiscal year are shown in Exhibit 3-34. Note that the filenames on the list are generically named for each year. Therefore, it is the subdirectory, rather than the filename itself, that establishes the year or alternative that a given file represents. The user should reference chapter 1 of the Version 2.1 D #50 model User's Guide for more detail on subdirectory and filename specifications required in the model application.

Exhibit 3-24: File Format Description of the Land Use File

Columns	Format	Field Description
1- 4	I4	TAZ (1-2191)
8- 15	I8	Households
16- 23	I8	Household Population
24- 31	I8	Grouped Quarters Population
32- 39	I8	Total Population
40- 47	I8	Total Employment
48- 55	I8	Industrial Employment
56- 63	I8	Retail Employment
64- 71	I8	Office Employment
72- 79	I8	Other Employment
80- 81	I2	Jurisdiction Code (0-23) <i>0/dc, 1/mtg, 2/pg, 3/alr/, 4/alx,5, ffx, 6/dn, 7/ pw, 8/(unused), 9/ frd, 10/how, 11/aa, 12/chs, 13/(unused), 14/car, 15/cal, 16/stm, 17/ kg, 18/fbg, 19/stf, 20/spts, 21/fau, 22/clk, 23/jef</i>
83- 92	F10.4	Gross Land Area (in sq. miles)
94- 95	I2	Ratio of zonal HH median income to regional median HH income in tenths (e.g., a value of <i>10</i> indicates a ratio of 1.0), based on the 1990 CTPP.
97- 98	I2	Airline distance from the TAZ centroid to the nearest external station in whole miles.

Exhibit 3-27: Rail Station/PNR Lot File Format Description

Columns	Format	Field Description
1-5	I5	Sequence Number
10	A1	Mode Code (M/Metrorail, C/Commuter Rail, B/Bus)
15	A1	Parking Available? (Y/N)
18	A1	Station Active? (Y/N)
21-44	A24	Station Name/PNR lot name
45-50	I6	Rail Station Network Centroid (2251-2500)
51-55	I5	Rail Station/PNR TAZ location (1-2191)
56-60	I5	Rail Station Node (7301-7399, 7600-7733)
61-65	I5	Parking lot node
66-70	I5	1 st Bus Node
71-75	I5	2 nd Bus Node
76-80	I5	3rd Bus Node
81-85	I5	4th Bus Node
94-100	I7	X Coordinate of Station / PNR lot (NAD 83)
105-110	I6	Y Coordinate of Station / PNR lot (NAD 83)
141-145	I5	Year of Station/PNR lot Opening

Exhibit 3-28: Rail Link File Format Description

Columns	Format	Field Description
1-5	I5	A Node
6-10	I5	B Node
15-19	I5	Distance in 1/100ths of miles
21-25	F5.2	Speed (mph)
37-37	I1	Rail Mode Number (3-5)

Exhibit 3-29: Zonal Walk Percentage File Format Description

Columns	Format	Field Description
4-8	I5	TAZ Number
9-17	I9	Total Land Area
24-30	I7	'short' walk area to rail (Metrorail, commuter rail)
36-42	I7	'long' walk area to rail (Metrorail, commuter rail)
49-55	I7	'short' walk area to non-rail transit
61-67	I7	'long' walk area to non-rail transit
73-81	I9	Non-walking area to ANY transit
85-91	I7	Avg. 'Short' Walk Distance to Metrorail (in miles)
95-101	I7	Avg. 'Long' Walk Distance to Metrorail (in miles)
106-112	I7	Avg. 'Short' Walk Distance to Commuter Rail (in miles)
116-122	I7	Avg. 'Long' Walk Distance to Commuter Rail (in miles)
127-133	I7	Avg. 'Short' Walk Distance to Bus (in miles)
137-143	I7	Avg. 'Long' Walk Distance to Bus (in miles)
149-155	I7	Avg. 'Short' Walk Distance to ANY Transit (in miles)
161-167	I7	Avg. 'Long' Walk Distance to ANY Transit (in miles)
170-174	I5	Nearest Rail Station (Metrorail or Commuter Rail) w/in 1.0 mi
176-180	I5	Nearest Bus Stop Node w/in 1.0 mi

Note: area measurements are in square miles and do not include major bodies of water; 'Short' references below are defined as within 1/3 mile; 'Long' walk areas are those beyond 1/3 of a mile and within 1.0 mile

Exhibit 3-30: GIS-Walk Link File

Columns	Format	Field Description
1-5	I5	TAZ Number
6-10	I5	Transit Stop nodes within 1.0 mile
11-15	F5.2	Distance from TAZ centroid to stop node in miles
